PRELIMINARY AMENDMENT

Box PCT Assistant Commissioner for Patents Washington, D.C. 20231

Dear Sir:

In connection with the above-identified application filed herewith, please enter the following preliminary amendment.

IN THE ABSTRACT

Insert the attached Abstract page into the application as the last page thereof.

IN THE SPECIFICATION

A courtesy copy of the present specification is enclosed herewith. However, the World Intellectual Property Office (WIPO) copy should be relied upon if it is already in the U.S. Patent Office.

IN THE CLAIMS

Please amend the following claims as indicated below. A marked-up copy of all claims is attached for reference.

- 4. (Amended) A secondary or three-dimensional structure of a glycosyltransferase as defined in claim 1 that is a crystalline form.
- 5. (Amended) A secondary or three-dimensional structure of a glycosyltransferase as defined in claim 1, wherein the glycosyltransferase is an N-acetylglucosaminyltransferase.
- 6. (Amended) A secondary or three-dimensional structure of a glycosyltransferase as defined in claim 1 having one or both of the following characteristics:
 - (a) a N-terminal domain comprising an eight-stranded mixed β -sheet flanked by six helices, and a small two-stranded antiparallel β -sheet; and
 - (b) a C-terminal domain comprising a four-stranded mixed β -sheet flanked by three α -helices and a short β -finger.
- 8. (Amended) A secondary or three-dimensional structure of a glycosyltransferase as defined in claim 1 having the structural coordinates of a glycosyltransferase listed in Table 1, 2, 3, or 4.
- 13. (Amended) A crystalline form as claimed in claim 11 further characterized by the parameters, diffraction statistics, and/or refinement statistics in Table 6.
- 14. (Amended) A secondary or three-dimensional structure of a binding site of a secondary or three-dimensional structure of a glycosyltransferase as defined in claim1.

- 16. (Amended) A secondary or three-dimensional structure of a binding site of a glycosyltransferase as defined in claim 1 wherein the binding site is also defined by the atomic interactions of Table 5, preferably the enzyme atomic contacts.
- 17. (Amended) A secondary or three-dimensional structure of a binding site of a glycosyltransferase as defined in claim 1 wherein the binding site is defined by atomic interactions 1 to 5; 6 and 7; 8, 9 and 10; 1 to 13; 14 to 21; 22 to 27; 1 to 13; 1 to 21; or 11, 12, 13, and 27 listed in Table 5, or the enzyme atomic contacts for these atomic interactions listed in Table 5.
- 18. (Amended) A secondary or three-dimensional structure of an spsA GnT 1 core (SGC) domain of a secondary or three-dimensional structure of a glycosyltransferase as defined in claim 1.
- 20. (Amended) A modulator of the activity of a glycosyltransferase derived from a secondary or three-dimensional structure as claimed in claim 1.
- 23. (Amended) A method for identifying a modulator of a glycosyltransferase by determining binding interactions between a test compound and secondary or three-dimensional structures of binding sites as defined in claim 1 comprising:
 - (a) generating the binding sites on a computer screen;
 - (b) generating a test compound with its spatial structure on the computer screen; and
 - (c) testing to determine whether the test compound binds to a selected number of binding sites.
- 24. (Amended) A method for identifying a potential modulator of a glycosyltransferase function comprising the steps:

- (a) docking a computer representation of a compound from a computer data base with a computer representation of a secondary or three-dimensional structure of a glycosyltransferase or a binding site as defined claim 1, to obtain a complex;
- (b) determining a conformation of the complex with a favourable geometric fit and favourable complementary interactions; and identifying compounds that best fit the selected site as potential modulators of the glycosyltransferase.
- 25. (Amended) A method for identifying a potential modulator of a glycosyltransferase function comprising the steps:
 - (a) modifying a computer representation of a compound complexed with a secondary or three-dimensional structure of a glycosyltransferase or a binding site as defined in claim 1, by deleting or adding a chemical group or groups;
 - (b) determining a conformation of the complex with a favourable geometric fit and favourable complementary interactions; and
 - (c) identifying a compound that best fits the binding cavity as a potential modulator of a glycosyltransferase.
- 26. (Amended) A method for identifying a potential modulator of a glycosyltransferase function comprising the steps:
 - (a) selecting a computer representation of a compound complexed with a secondary or three-dimensional structure of a glycosyltransferase or a binding site as defined in claim 1; and
 - (b) searching for molecules in a data base that are similar to the compound using a searching computer program, or replacing portions of the compound with similar

- chemical structures from a data base using a compound building computer program.
- 27. (Amended) A modulator of a glycosyltransferase identified by a method as claimed in in claim 1.
- 28. (Amended) A method for designing potential inhibitors of a glycosyltransferase comprising the step of using the structural coordinates of a sugar nucleotide donor or acceptor or component thereof, defined in relation to it spatial association with the three dimensional structure of a glycosyltransferase or a binding site as defined in claim 1, to generate a compound that is capable of associating with the glycosyltransferase or binding cavity thereof.
- 29. (Amended) A modulator of a glycosyltransferase based on a three-dimensional structure of a sugar nucleotide donor, an acceptor, or a component thereof, defined in relation to the sugar nucleotide donor's or acceptor's spatial association with a secondary or three-dimensional structure of a glycosyltransferase or binding site as defined in claim 1.
- 30. (Amended) A pharmaceutical composition comprising a modulator as claimed in claim 1 either alone or with other active substances.
- 32. (Amended) Use of a modulator identified by the methods of claim 1 in the preparation of a medicament to treat a disease associated with a glycosyltransferase with inappropriate activity in a cellular organism.
- 34. (Amended) Machine readable media encoded with data representing the structural coordinates of a secondary or three-dimensional structure of a glycosyltransferase or a binding site as defined in claim 1.

MARKED-UP COPY OF CLAIMS

- 1. A secondary or three-dimensional structure of a purified glýcosyltransferase when it associates with a nucleotide sugar donor, acceptor, or metal cofactor.
- 2. A secondary or three-dimensional structure of a purified glycosyltransferase in association with a moiety.
- 3. A secondary or three-dimensional structure as claimed in claim 2, wherein the moiety is a nucleotide sugar donor, acceptor, metal cofactor, or heavy metal atom.
- 4. A secondary or three-dimensional structure of a glycosyltransferase as defined in [any of the preceding] claim[s] 1 that is a crystalline form.
- 5. A secondary or three-dimensional structure of a glycosyltransferase as defined in [any of the preceding] claim[s] 1, wherein the glycosyltransferase is an N-acetylglucosaminyltransferase.
- 6. A secondary or three-dimensional structure of a glycosyltransferase as defined in [any of the preceding] claim[s] 1 having one or both of the following characteristics:
 - (b) an N-terminal domain comprising an eight-stranded mixed β -sheet flanked by six helices, and a small two-stranded antiparallel β -sheet; and
 - (c) a C-terminal domain comprising a four-stranded mixed β -sheet flanked by three α -helices and a short β -finger.
- 7. A secondary or three-dimensional structure of a glycosyltransferase as defined in claim 6 further characterized by the N-terminal domain and C-terminal domain being connected by a linker region, which wraps halfway around the N-terminal domain before starting the first helix of the C-terminal domain.

- 8. A secondary or three-dimensional structure of a glycosyltransferase as defined in [any of the preceding] claim[s] 1 having the structural coordinates of a glycosyltransferase listed in Table 1, 2, 3, or 4.
- 9. A secondary or three-dimensional structure of a glycosyltransferase in association with a sugar nucleotide donor having the structural coordinates of a glycosyltransferase and a sugar nucleotide donor listed in Table 3.
- 10. A secondary or three-dimensional structure of a glycosyltransferase in association with an acceptor having the structural coordinates of a glycosyltransferase and an acceptor listed in Table 4.
- 11. A crystalline form of a glycosyltransferase having a unit cell with dimensions of a = $40.4 \pm 3 \text{ Å}$, b= $82.4 \pm 3 \text{ Å}$, and c = $102.5 \pm 3 \text{ Å}$.
- 12. A crystalline form of an N-acetylglucosaminyltransferase having the structural coordinates listed in Table 1, 2, 3, or 4, and a unit cell with dimensions of $a = 40.4 \pm 3 \text{ Å}$, $b=82.4 \pm 3 \text{ Å}$, and $c=102.5 \pm 3 \text{ Å}$.
- 13. A crystalline form as claimed in claim 11 [or 12] further characterized by the parameters, diffraction statistics, and/or refinement statistics in Table 6.
- 14. A secondary or three-dimensional structure of a binding site of a secondary or three-dimensional structure of a glycosyltransferase as defined in [any of the preceding] claim[s] 1.
- 15. A secondary or three-dimensional structure of a binding site as claimed in claim 14 wherein the binding site is defined by its association with one or more of a disphosphate group of a sugar nucleotide donor, a nucleotide of a sugar nucleotide

- donor, a sugar of a nucleotide of a sugar nucleotide donor, a selected sugar of a sugar nucleotide donor that is transferred to an acceptor, and/or an acceptor.
- 16. A secondary or three-dimensional structure of a binding site of a glycosyltransferase as defined in [the preceding] claim[s] 1 wherein the binding site is also defined by the atomic interactions of Table 5, preferably the enzyme atomic contacts.
- 17. A secondary or three-dimensional structure of a binding site of a glycosyltransferase as defined in [the preceding] claim[s] 1 wherein the binding site is defined by atomic interactions 1 to 5; 6 and 7; 8, 9 and 10; 1 to 13; 14 to 21; 22 to 27; 1 to 13; 1 to 21; or 11, 12, 13, and 27 listed in Table 5, or the enzyme atomic contacts for these atomic interactions listed in Table 5.
- 18. A secondary or three-dimensional structure of an spsA GnT 1 core (SGC) domain of a secondary or three-dimensional structure of a glycosyltransferase as defined in [any of the preceding] claim[s] 1.
- 19. A secondary or three-dimensional structure of an SGC domain as claimed in claim 18 characterized by an eight-stranded mixed β-sheet, flanked by six helices, and a small two-stranded antiparallel β-sheet.
- 20. A modulator of the activity of a glycosyltransferase derived from a secondary or three-dimensional structure as claimed in [any of the preceding] claim[s] 1.
- 21. A method of determining three-dimensional structures of polypeptides with unknown structure comprising the step of applying the structural coordinates of Table 1, 2, 3, or 4.

- 22. A method for identifying a potential modulator of a glycosyltransferase, or binding sites or domains thereof, comprising the step of using the structural coordinates of Table 1, 2, 3, or 4 that define a glycosyltransferase or binding sites or domains thereof, to computationally evaluate a test compound for its ability to associate with the glycosyltransferase, binding sites or domains thereof, wherein a test compound that associates is a potential modulator of a glycosyltransferase.
- 23. A method for identifying a modulator of a glycosyltransferase by determining binding interactions between a test compound and secondary or three-dimensional structures of binding sites as defined in [any of the preceding] claim[s] 1 comprising:
 - (a) generating the binding sites on a computer screen;
 - (b) generating a test compound with its spatial structure on the computer screen; and
 - (c) testing to determine whether the test compound binds to a selected number of binding sites.
- 24. A method for identifying a potential modulator of a glycosyltransferase function comprising the steps:
 - (c) docking a computer representation of a compound from a computer data base with a computer representation of a secondary or three-dimensional structure of a glycosyltransferase or a binding site as defined in [any of the preceding] claim[s] 1, to obtain a complex;
 - (d) determining a conformation of the complex with a favourable geometric fit and favourable complementary interactions; and

- (e) identifying compounds that best fit the selected site as potential modulators of the glycosyltransferase.
- 25. A method for identifying a potential modulator of a glycosyltransferase function comprising the steps:
 - (d) modifying a computer representation of a compound complexed with a secondary or three-dimensional structure of a glycosyltransferase or a binding site as defined in [any of the preceding] claim[s] 1, by deleting or adding a chemical group or groups;
 - (e) determining a conformation of the complex with a favourable geometric fit and favourable complementary interactions; and
 - (f) identifying a compound that best fits the binding cavity as a potential modulator of a glycosyltransferase.
- 26. A method for identifying a potential modulator of a glycosyltransferase function comprising the steps:
 - (a) selecting a computer representation of a compound complexed with a secondary or three-dimensional structure of a glycosyltransferase or a binding site as defined in [any of the preceding] claim[s] 1; and
 - (b) searching for molecules in a data base that are similar to the compound using a searching computer program, or replacing portions of the compound with similar chemical structures from a data base using a compound building computer program.
- 27. A modulator of a glycosyltransferase identified by a method as claimed in [any of the preceding] claim[s] 1.

- 28. A method for designing potential inhibitors of a glycosyltransferase comprising the step of using the structural coordinates of a sugar nucleotide donor or acceptor or component thereof, defined in relation to it spatial association with the three dimensional structure of a glycosyltransferase or a binding site as defined in [any of the preceding] claim[s] 1, to generate a compound that is capable of associating with the glycosyltransferase or binding cavity thereof.
- 29. A modulator of a glycosyltransferase based on a three-dimensional structure of a sugar nucleotide donor, an acceptor, or a component thereof, defined in relation to the sugar nucleotide donor's or acceptor's spatial association with a secondary or three-dimensional structure of a glycosyltransferase or binding site as defined in [the preceding] claim[s] 1.
- 30. A pharmaceutical composition comprising a modulator as claimed in [any of the preceding] claim[s] 1 either alone or with other active substances.
- 31. A method of treating a disease associated with a glycosyltransferase with inappropriate activity in a cellular organism, comprising:
 - (a) administering a pharmaceutical composition as claimed in claim 30; and
 - (b) activating or inhibiting a glycosyltransferase to treat the disease.
- 32. Use of a modulator identified by the methods of [any of the preceding] claim[s] 1 in the preparation of a medicament to treat a disease associated with a glycosyltransferase with inappropriate activity in a cellular organism.
- 33. Use of structural coordinates of a glycosyltransferase structure as set out in Table 1, 2, 3, or 4 to manufacture a medicament.
- 34. Machine readable media encoded with data representing the structural coordinates of

- a secondary or three-dimensional structure of a glycosyltransferase or a binding site as defined in [any of the preceding] claim[s] $\underline{1}$.
- 35. A machine readable media as claimed in claim 34 wherein the data also includes structural coordinates for a nucleotide sugar donor, acceptor, metal cofactor, or heavy metal atom.

TITLE: Glycosyltransferases Structures

FIELD OF THE INVENTION

The invention relates to the secondary and three dimensional structures of glycosyltransferases. The atomic coordinates that define the structure and any compounds bound to the structure may be used to determine glycosyltransferase homologues and the structures of polypeptides with unknown structure, and to identify modulators of glycosyltransferases.

BACKGROUND OF THE INVENTION

The oligosaccharide chains of N- and O-linked glycoproteins play a crucial role in a number of biological processes. Their biosynthesis and degradation pathways are therefore areas of significant interest for biology, medicine, and biotechnology. The assembly of the various types of oligosaccharides involves several glycosidases and glycosyltransferases. In comparison with glycosidases, the mechanisms of which have been characterized in some detail, mechanistic investigations on glycosyltransferases have not yet undergone much scrutiny, although some kinetic studies have been reported.

Glycosyltransferases are a diverse group of enzymes that catalyze the transfer of a single monosaccharide unit from a donor to the hydroxyl group of an acceptor saccharide. The acceptor can be either a free saccharide, glycoprotein, glycolipid, or polysaccharide. The donor can be a nucleotide-sugar, or dolichol-phosphate-sugar. Glycosyltransferases show a precise specificity for both the sugar acceptor and donor, and generally require the presence of a metal cofactor.

SUMMARY OF THE INVENTION

Broadly stated, the present invention relates to the secondary and three-dimensional structures of glycosyltransferases, and parts thereof. The glycosyltransferase structure may be the structure the enzyme takes up when it is associated with one or more moieties (e.g. an acceptor, a sugar nucleotide donor, or components thereof). The invention also contemplates a glycosyltransferase structure comprising a secondary or three-dimensional structure of a glycosyltransferase in association with a moiety. The defined boundaries and properties of the structures and any of the moieties bound to it are pertinent to methods for determining the secondary or three-dimensional structures of polypeptides with unknown structure, and to methods that identify modulators of glycosyltransferases. These modulators are potentially useful as therapeutics for diseases, including (but not limited to) tumor growth, metastasis of tumors, bacterial, viral, and parasitic infections, and inflammatory diseases such as rheumatoid arthritis, asthma, inflammatory bowel disease, and atherosclerosis.

In an embodiment, the invention provides a crystalline form of a polypeptide corresponding to a glycosyltransferase, or a part thereof. The invention preferably contemplates a crystalline form a glycosyltransferase takes up when it is complexed with a moiety, including a nucleotide sugar donor, acceptor, metal cofactor, or heavy metal atom. The crystalline form may also comprise one or more heavy metal atoms, or at least one compound. A unit cell of the crystalline form of the invention may have dimensions of about $a = 40.4 \pm 3.0 \text{ Å}$, $b=82.4 \pm 3.0 \text{ Å}$, $c = 102.5 \pm 3.0 \text{ Å}$.

A glycosyltransferase structure of the invention may also be characterized by one or more of the following:

10

15

20

25

30

35

- (a) an N-terminal domain (amino acid residues 106-317 in Table 3) comprising an eight-stranded mixed β-sheet (β1-β8 in Figure 25) flanked by six helices (α1-α6 in Figure 25) and a small two-stranded antiparallel β-sheet (β4' and β8' in Figure 25); and
- (b) a C-terminal domain (amino acid residues 354-447 in Table 3) comprising a four-stranded mixed β-sheet (β9, β10, β13, and β14 in Figure 25) flanked by three α-helices (α7-α9 in Figure 25) and a short β-finger (β11 and β12 in Figure 25).

The N-terminal domain and C-terminal domain may be connected by a linker region (residues 331 to 353 in Table 3) which wraps halfway around the N-terminal domain before starting the first helix of the C-terminal domain.

The crystalline form may also be specifically characterized by the parameters, diffraction statistics and/or refinement statistics set out in Table 6.

The invention also contemplates a secondary or three-dimensional structure (e.g. a crystalline form) of a domain of a glycosyltransferase. In accordance with one aspect, the invention contemplates a secondary or three-dimensional structure of a domain comprising an eight-stranded mixed β -sheet, flanked by six helices and a small two-stranded antiparallel β -sheet. The domain is also referred to herein as the "spsA GnT 1 core domain" or "SGC domain". In accordance with a preferred embodiment, the invention contemplates a domain comprising an eight-stranded mixed β -sheet represented as β 1- β 8 in Figure 25, flanked by six helices represented by α 1- α 6 in Figure 25, and a small two-stranded antiparallel β -sheet represented by β 4' and β 8' in Figure 25. A secondary or three-dimensional structure of a polypeptide comprising an SGC domain of the invention is also within the scope of the invention.

The invention further contemplates a loop structure of a glycosyltransferase. A loop structure may be characterized as the structure adjacent to the nucleotide-sugar donor binding site comprising amino acid residues 318-330 in Table 3. The loop structure may be further characterized by amino acid residues 320-323 forming a type IV turn and amino acid residues 324-330 making one complete turn of an α -helix. A secondary or three dimensional structure of a polypeptide comprising a loop structure of the invention is also within the scope of the invention.

The invention also relates to a method of forming a crystalline form of the invention.

The invention also features a method of determining secondary or three-dimensional structures of polypeptides with unknown structure comprising the step of applying the structural atomic coordinates of a crystalline form of a glycosyltransferase of the invention.

The invention also provides a secondary or three-dimensional structure of a binding site of a glycosyltransferase. Binding sites include the binding sites for one or more of a disphosphate or pyrophosphate group of a sugar nucleotide donor, a nucleotide of a sugar nucleotide donor, a nitrogeneous heterocyclic base (preferably a pyrimidine base, more preferably uracil) of a sugar nucleotide donor, a sugar of the nucleotide of a sugar nucleotide donor, a selected sugar of a sugar nucleotide donor that is transferred to an acceptor, and/or an acceptor. The secondary or three-dimensional structure of a binding site may be defined by selected atomic contacts in the site. Thus, broadly stated the present invention provides a secondary or three-dimensional structure of a binding site of a glycosyltransferase defined by one or more atomic interactions or enzyme

10

15

20

25

30

35

atomic contacts as set forth in Table 5. Each of the atomic interactions is defined in Table 5 by an atomic contact (more preferably, a specific atom where indicated) on the sugar nucleotide donor or acceptor, and an atomic contact (more preferably a specific atom where indicated) on the glycosyltransferase.

The invention also relates to modulators derived from a secondary or three-dimensional structure of a glycosyltransferase, binding sites, atomic interactions, or atomic contacts thereof, or a domain of a secondary or three-dimensional structure of a glycosyltransferase, including a SGC domain. Preferably, the modulators are derived from binding sites for a sugar nucleotide donor or parts thereof, an acceptor or parts thereof, including the SGC domain, and the binding site described herein as the loop structure. The invention provides inhibitors that are derived from a DxD motif, for example, peptides having the sequences as shown in Figures 27 and 31 (SEQ ID NOs 1-9).

The present invention also contemplates a method of identifying a modulator of a glycosyltransferase, a binding site or a domain thereof, comprising the step of using the structural coordinates of a glycosyltransferase, binding sites, atomic interactions, or atomic contacts thereof, or domain thereof, to computationally evaluate a test compound for its ability to associate with the glycosyltransferase, binding site, or domain thereof. Use of the structural coordinates of a glycosyltransferase structure, binding sites, atomic interactions, or atomic contacts of the invention to identify a modulator is also provided.

In an embodiment of the invention, a method is provided for identifying a modulator of a glycosyltransferase by determining binding interactions between a test compound and a binding site of a glycosyltransferase, or atomic interactions, or atomic contacts thereof, or a domain of a glycosyltransferase defined in accordance with the invention comprising:

- (a) generating the binding site, atomic interactions, atomic contacts, or domain on a computer screen;
- (b) generating a test compound with its spatial structure on the computer screen; and
- (c) testing to determine whether the test compound binds to the binding site, a selected number of atomic contacts, or the domain.

Methods are also provided for identifying a potential modulator of a glycosyltransferase function by docking a computer representation of a compound with a computer representation of a structure of a glycosyltransferase or a part thereof, that is defined by the atomic structural coordinates, atomic interactions, or atomic contacts described herein.

In an embodiment the method comprises the following steps:

- (a) docking a computer representation of a compound from a computer data base with a computer representation of a selected site (e.g. the sugar nucleotide donor or acceptor binding site, loop structure, or SGC domain) on a glycosyltransferase defined in accordance with the invention, to obtain a complex;
- (b) determining a conformation of the complex with a favourable geometric fit and favourable complementary interactions; and
- (c) identifying compounds that best fit the selected site as potential modulators of the glycosyltransferase.

10

15

20

25

30

35

In another embodiment the method comprises the following steps:

- (a) modifying a computer representation of a compound complexed with a selected site (e.g. sugar nucleotide donor or acceptor binding site, loop structure, or SGC domain) on a glycosyltransferase defined in accordance with the invention, by deleting or adding a chemical group or groups;
- (b) determining a conformation of the complex with a favourable geometric fit and favourable complementary interactions; and
- (c) identifying a compound that best fits the selected site as a potential modulator of a glycosyltransferase.

In still another embodiment the method comprises the following steps:

- (a) selecting a computer representation of a compound complexed with a selected site (e.g. sugar nucleotide donor or acceptor binding site, loop structure, or SGC domain) on a glycosyltransferase defined in accordance with the invention; and
- (b) searching for molecules in a data base that are similar to the compound using a searching computer program, or replacing portions of the compound with similar chemical structures from a data base using a compound building computer program.

A compound that interacts with a glycosyltransferase, binding sites or atomic contacts thereof, or a domain thereof, identified using a method of the invention may be used as a modulator of any glycosyltransferase or composition bearing the interacting binding site, atomic contacts, or domain. Therefore, the invention features a modulator of a glycosyltransferase identified by a method of the invention.

The invention further contemplates classes of modulators of glycosyltransferases based on the three-dimensional structure of a sugar nucleotide donor, or component thereof, or acceptor, defined in relation to the sugar nucleotide donor's or acceptor's spatial association with a glycosyltransferase structure. Generally, a method is provided for designing potential inhibitors of a glycosyltransferase comprising the step of using the structural coordinates of a sugar nucleotide donor or acceptor or component thereof, defined in relation to it spatial association with the glycosyltransferase structure or a binding site thereof, to generate a compound that is capable of associating with the glycosyltransferase or binding site thereof.

It will be appreciated that a modulator of a glycosyltransferase may be identified by generating an actual secondary or three-dimensional models of a binding site, synthesizing a compound, and examining the components to find whether the required interaction occurs.

A potential modulator of a glycosyltransferase identified by a method of the present invention may be confirmed as a modulator by synthesizing the compound, and testing its effect on the glycosyltransferase in an assay for that glycosyltransferase's enzymatic activity. Such assays are known in the art.

A modulator of the invention may be converted using customary methods into pharmaceutical compositions. A modulator may be formulated into a pharmaceutical composition containing a modulator either alone or together with other active substances.

Therefore, the methods of the invention for identifying modulators may comprise one or more of the following additional steps:

10

15

20

25

30

35

- (a) testing whether the modulator is a modulator of the activity of a glycosyltransferase, preferably testing the activity of the modulator in cellular assays and animal model assays;
- (b) modifying the modulator;
- (c) optionally rerunning steps (a) or (b); and
- (d) preparing a pharmaceutical composition comprising the modulator.

Steps (a), (b) (c) and (d) may be carried out in any order, at different points in time, and they need not be sequential.

The invention also contemplates a method of treating a disease associated with a glycosyltransferase with inappropriate activity in a cellular organism, comprising:

- (a) administering a modulator of the invention in an acceptable pharmaceutical preparation; and
- (b) activating or inhibiting a glycosyltransferase to treat the disease.

The invention provides for the use of a modulator identified by the methods of the invention in the preparation of a medicament to treat a disease associated with a glycosyltransferase with inappropriate activity in a cellular organism. Use of the structural coordinates of a glycosyltransferase structure of the invention to manufacture a medicament is also provided.

Another aspect of the invention provides machine readable media encoded with data representing the coordinates of the secondary or three dimensional structure of a glycosyltransferase, binding sites or atomic contacts thereof, or domain as defined herein, or the three dimensional structure of a sugar nucleotide donor or acceptor defined in relation to its spatial association with a glycosyltransferase structure as defined herein. The invention also provides computerized representations of the secondary or three-dimensional structures of the invention, including any electronic, magnetic, or electromagnetic storage forms of the data needed to define the structures such that the data will be computer readable for purposes of display and/or manipulation.

These and other aspects of the present invention will become evident upon reference to the following detailed description and attached drawings.

DESCRIPTION OF THE DRAWINGS

The invention will now be described in relation to the drawings in which:

Figure 1 is a secondary structure diagram of GnT-1, as viewed along the beta sheet, from strand "b3." Note the eight-stranded beta sheet twist in the foreground, and the four-stranded beta sheet, offset in the background.

Figure 2 is a secondary structure diagram of GnT-1, showing a view from the side. The first domain is a mixed eight-stranded beta sheet, backed by alpha helices, indicated by "b" for the beta strands and "a" for the alpha helices. The second domain is a mixed four-stranded beta sheet, again backed by helices, and indicated with capital "B" and "A," respectively.

Figure 3 is a sample of experimental MAD MeHg-derivative GnT-1 density, from the bottom of the active site pocket. The Hg position was identified using SOLVE. SHARP was used to refine the Hg parameters, and CCP4 dm was used for solvent-flattening and histogram matching, giving the shown map.

Figure 4 is a hydrophobic surface diagram of the top and bottom of GnT-1, with hydrophobic regions in green. Note the patch in the pocket, as well as at the base of the alpha-helix "tower."

10

15

20

25

30

35

Figure 5 is an electrostatic surface diagram of the top and bottom of GnT-1, with acidic regions in red, and basic regions in blue. Note the large acidic patch to one side of the active site pocket.

Figure 6 is a conservation diagram of the active site pocket of GnT-1. Conserved regions are indicated in red, with "A" being fully conserved, and "0" unconserved. Alignments of active GnT-1's (rabbit, human, rat, mouse, golden hamster, chinese hamster, C. elegans 1 #1 and #3, and frog) was performed using CLUSTALX, and conservation was calculated using AMAS. Note the highly conserved active site pocket.

Figure 7 is a worm diagram of the GnT-I structure with secondary structure shown. Beta strands are shown as arrows, and alpha helices are helices. UDP-GlcNAc and the Mn²⁺ ion are shown in the binding site.

Figure 8A through 8F are surface diagrams of the GnT-1 structure.UDP-GlcNAc and the Mn²⁺ ion are shown in the binding site. (8A) The phosphate-binding loop lid, which forms upon UDP-GlcNAc binding, is shown as a worm. (8B) The loop is shown as a surface. (8C) The surface has been colored according to potential. Basic potential is shown in blue, and acidic potential is shown in red; the loop is shown as a worm. (8D) As in 8C, but with the loop shown as a surface. (8E) The surface has been colored according to residue AMAS conservation index. Red regions are conserved, white are unconserved; the loop is shown as a worm. (8F) As in 8E, but with the loop shown as a surface.

Figure 9 are diagrams showing the active site of the GnT-1 enzyme. Asp291 is shown as a stick figure on the left side of the pocket, while the rest of the protein is shown as a surface. UDP-GlcNAc is shown as a stick figure on the right. Mn²⁺ has been shown as a sphere. (9A) The loop is shown as a worm. (9B) The loop is shown as a surface. Note the mannose-sized active site pocket.

Figure 10 is a surface diagram of GnT-1 bound to the model of the Man₅GlcNAc₂ acceptor. UDP-GlcNAc is shown as a stick, and the Mn²⁺ has been shown as a sphere. (10A) The acceptor model is shown as a stick figure. (10B) The acceptor has been shown as a space-filling van der Waals figure.

Figure 11 is the same as Figure 10 but from a different angle, showing the fit of the acceptor to the surface more visible. (11A) The acceptor has been shown as a stick figure, and the loop as a worm. (11B) The acceptor has been shown as a stick figure, and the loop as a surface. (11C) The acceptor has been shown as space-filling van der Waals spheres, and the loop as a surface. (11D) As in 11B, but with the surface colored according to residue conservation index. Note the correlation of the acceptor model to red conserved residues.

Figure 12 shows a model of the active site of GnT-1, with the base D291 (i.e. Asp292), the α-1,3 mannose O2, and the GlcNAc C1 joined by lines of small spheres. The protein backbone has been shown as an alpha-carbon trace, the acceptor Man₅GlcNAc₂ sugar, UDP-GlcNAc, and protein side-chains have been shown as stick figures, and the Mn²⁺ ion and bound water molecules have been shown as spheres.

Figure 13 shows a model of the overlay of GnT-1 (red), *Bacillus subtilis* nucleotide- diphospho-sugar transferase (spsA) (green), *Escherichia coli* N-acetylglucosamine 1-phosphate uridyltransferase (GlmU) (blue), and bovine β -1,4-galactosyltransferase T1 (galT) (cyan). Parts of the protein sequence not in the transferase fold are shaded a darker color.

Figure 14 shows the overlay of GnT-1 and GlmU from the model of Figure 13. The DALI z-score (a measure of structural similarity) for this overlay is 9.6. Dissimilar structures give scores less than 2; greater similarity gives a higher score.

Figure 15 shows the overlay of GnT-1 and β -1,4-galT from the model of Figure 13. The DALI z-score for this overlay is 10.6.

Figure 16 shows the overlay of GnT-1 and spsA from the model of Figure 13. The DALI z-score for this overlay is 15.7.

Figure 17 shows the model of Figure 13 from a different angle. Note the overlay of the helix-loophelix containing the catalytic base Asp residue (Asp 291 in GnT-1, Asp 191 in spsA, and Asp in galT).

Figure 18 shows the overlay of GnT-1 and GlmU from the model of Figure 17.

Figure 19 shows the overlay of GnT-1 and galT from the model of Figure 17.

Figure 20 shows the overlay of GnT-1 and spsA from the model of Figure 17.

Figure 21 shows the secondary structure of GnT-1. Helices are in red and β sheets are in green. Areas not in the conserved fold are darkened.

Figure 22 shows the secondary structure of GlmU. Helices are in red and β sheets are in green. β strand 6 has been deleted.

Figure 23 shows the secondary structure of galT. Helices are in red and β sheets are in green. β strand 3 has been deleted along with helix 2 leading into it. Instead, a small β finger N-terminal of the core domain and a β finger C-terminal of the core domain occupy the space of β strand 3.

Figure 24 shows the secondary structure of spsA. Helices are in red and β sheets are in green. All eight strands are present in the core domain.

Figure 25 is a GnT I Ribbon Diagram. Domain 1 is shown in cyan, the loop (residues 318 to 330) structured upon UDP-GlcNAc binding in red, the linker connecting Domain 1 and Domain 2 in green, Domain 2 in brown, and the UDP-GlcNAc and the Mn²⁺ ion are shown in yellow. All molecular images were prepared using SPOCK (Christopher, 1998) and rendered using Raster3D (Bacon, 1988; Merritt, 1994).

Figure 26 shows the electrostatic potential surface of GnT I, showing the acidic pocket into which the Mn²⁺ ion and UDP-GlcNAc bind. Acidic residues are colored red, and basic residues blue, with a gradient through ±10 kT. The UDP-GlcNAc is shown in yellow.

Figure 27 shows a sample of the AMAS analysis. Shown is an excerpt from the AMAS analysis, with residues in the region of the "DxD" motif (residues 211 to 213, EDD). GnT I sequences from rabbit human, mouse, rat, Chinese hamster, golden hamster, frog, and *C.elegans* genes gly-12 and gly-14, were aligned using ClustalX, and conservation was scored using AMAS. Unconserved residues are given a score of "0", and fully conserved residues are given a score of "A". (SEQ ID NO 1, 2, 3, 4, and 5).

Figure 28 shows AMAS surface analysis. AMAS residue scores, as shown in Figure 27, were then mapped onto the protein surface, with a gradient from green for a completely unconserved score of 0, to white for an AMAS score of 5, to red for a fully conserved score of "A".

Figure 29 shows a stereo ribbon overlay of the SGC domains of GnT 1 (red) and spsA (green). For clarity only the α -helices are labeled. UDP (spsA) and UDP-GlcNAc (GnT1) are shown in stick representation. M and C label the side chains of the metal binding and catalytic aspartic acid residues also shown in stick representation

Figure 30 shows topology diagrams of GnT I, spsA, GImU (an N-acetylglucosamine-1 -phosphate

uridyltransferase from *Escherichia coli*) and β 4Gal-T1 (a bovine galactosyl transferase, β -1,4-galactosyltransferase 1). Beta strands are shown as green triangles, and alpha helices as red circles, with missing elements shown in white. The secondary structural elements are labeled as in GnT I. The boxed gray region corresponds to the SGC domain..

Figure 31 shows a structural alignment of GnT I, spsA, GlmU and β4Gal-T1. (SEQ ID NO 6, 7, 8, and 9). Shown are two excerpts from the complete alignment, numbered according to rabbit GnT I. In the top alignment, the region around the DxD motif is shown, with the motif highlighted in magenta. In the bottom alignment, the area around the catalytic Asp is shown, with the catalytic residue again highlighted in magenta. Note that GImU is not a glycosyltransferase, but rather an N-acetylglucosamine-1-phosphate uridyl transferase, so it does not share the catalytic residue found in GnT I, spsA, and β4Gal-T1.

Figure 32 shows the GnT I substrate binding site. All interactions between the protein, the UDP-GIcNAc, the Mn²⁺ ion, and structured waters are shown as lines composed of small white spheres.

Figure 33A, B, and C show a stereo view of the UDP-GlcNAc/Mn²⁺ binding site. Carbon, oxygen, nitrogen, sulfur, and phosphorus are colored white, red, blue, yellow and purple respectively; water molecules are cyan and the Mn²⁺ ion is salmon. Hydrogen bonds are shown as dotted lines. The C1 of the *N*-acetylglucosamine moiety is labeled for reference. 33A Uracil and ribose interactions; 33B) Mn²⁺ and phosphate interactions; 33C) *N*-acetylglucosamine interactions.

Figure 34 shows interactions between GnT I, the Mn $^{2+}$ ion, and the UDP-GlcNAc phosphates. R117 is from the N-terminus of helix α 1, E211 and D213 are from the C-terminus of strand β 4, T315 and G317 are from strand β 8' and the N-terminus of the loop lid, and V321 and S322 are from the tip of the loop lid.

Figure 35 shows interactions between GnT I and the GlcNAc group of UDP-GlcNAc. Residue Y184 is in helix α 3, residue E211 is in strand β 4, residue L269 is from the C-terminus of strand β 7, residues F289, W290, D291 and R295 are from helix α 6, and L331 is from the C-terminal end of the loop lid. D291 is the only Asp that is close enough to the GlcNAc Cl to act as the catalytic base.

Figure 36 shows GnT I overlaid on spsA: GnT I appears in red, and spsA in green. In this Figure, the position of the ligands is shown. GnT I is bound to UDP-GlcNAc, shown as a red stick figure, along with a Mn²⁺ ion, shown as a red sphere near Asp213; spsA is bound to UDP, shown as a green stick figure, along with a Mn²⁺ ion, shown as a green sphere near Asp 99. Note how the nucleotides and proteins overlay very closely. The catalytic base residue in GnT I, Asp 291, identified by this structure, has an analogous residue in spsA, Asp 191. This predicts that Asp 191 is the catalytic base in spsA. The catalytic base was not identifiable with the spsA x-ray crystal structure alone, due to the absence in the spsA structure of the sugar residue normally attached to the UDP.

Figure 37 shows GnT I overlaid on β 1, 4-galT: GnT I appears in red, and β -1,4-galT in cyan. Again, the ligands of GnT I are shown, as in Figure 36. The ligand in the β -1,4-galT x-ray crystal structure, UDP, is shown as a stick figure; the Mn²+ normally required in the reaction is absent, as is the sugar part of the donor sugar-nucleotide. Again, GnT I's Asp 291 has an analogous galT residue, Asp318. This predicted to be the catalytic base in β -1,4-galT by the GnT I structure.

Figure 38 shows GnT I overlaid on GlmU: GnT I appears in red, and GlmU in navy blue. The ligands

10

25

30

of GnT I are shown in red, as in Figures 36 and 37. The GlmU product, UDP-GlcNAc, is shown as a navy blue stick figure. As GlmU is not a transferase, these two enzymes do not catalyse the same reaction, and thus the residues involved in enzymatic action are expected to be different. However, the similar fold and similar location of sugar-nucleotide binding, suggests that these enzymes may have evolved from an extremely distant common ancestor.

Figure 39 shows the DxD Motif. Atom colors and labels are as in Figure 33. Letters i, to i+3 correspond to the residues of the type 1 β -turn. The hydrogen bond characteristic of this turn type is shown in green.

Figure 40A and 40B shows a stereo diagram of the structured loop and the acceptor binding pocket. Atom colors and labels as in Figure 33. Backbone tubes and molecular surfaces are color coded as follows: red, structured loop; green, linker region; cyan, Domain 1; brown, Domain 2. 40A) Structured loop and UDP-GlcNAc/Mn²⁺ interactions; 40B) Surface representation of the acceptor binding pocket. The side chain of the catalytic base (D291) and the *N*-acetylglucosamine moiety of the UDP-GlcNAc are seen at the base of the pocket.

15 <u>DETAILED DESCRIPTION OF THE INVENTION</u>

Summary of Tables 1 to 8

- Table 1- structural coordinates of an N-acetylglucosaminyl transferase I (GnT-1) native structure.
- Table 2 -structural coordinates of a GnT-1 with bound MeHg.
- Table 3 -structural coordinates of a rabbit GnT-1 bound to UDP-GlcNAc and a manganese 2+ ion.
- Table 4 structural coordinates of a GnT-1 with acceptor.
 - Table 5 Intermolecular Contacts of GnT-1-UDP-GicNAc Complex.
 - Table 6 crystallographic data and refinement statistics.
 - Table 7 The UDP-GlcNAc binding site.
 - Table 8 Protein threading results.

In Tables 1 to 4, from the left, the second column identifies the atom number; the third identifies the atom type; the fourth identifies the amino acid type; the fifth identifies the residue number; the sixth identifies the x coordinates; the seventh identifies the y coordinates; the eighth identifies the z coordinates; the ninth identifies the occupancy; and the eleventh identifies the temperature factor.

Definitions:

Unless otherwise indicated, all terms used herein have the same meaning as they would to one skilled in the art of the present invention. Practitioners are particularly directed to Current Protocols in Molecular Biology (Ansubel) for definitions and terms of the art.

"Glycosyltransferase structure" or "glycosyltransferase secondary or three-dimensional structure" refers to the three-dimensional structure (i.e. tertiary structure) or arrangement of secondary structural elements of a purified polypeptide comprising a glycosyltransferase. A glycosyltransferase structure may be in association with or complexed with a moiety including a heavy metal atom or metal cofactor. A glycosyltransferase structure may be in crystalline form.

10

15

20

25

30

35

The term "crystalline form" in the context of the invention, is a crystal formed from an aqueous solution comprising a purified polypeptide comprising a glycosyltransferase. The glycosyltransferase is, preferably a glycosyltransferse with an SGC domain, including but not limited to a glycosyltransferase structurally related to N-acetylglucosaminyltransferase I to VIII, preferably N-acetylglucosaminyltransferase I. A crystalline form of a glycosyltransferase, is characterized as being capable of diffracting x-rays in a pattern defined by one of the crystal forms depicted in Blundel et al 1976, Protein Crystallography, Academic Press. A crystalline form may include a crystal structure in association with one or more moieties, including heavy-metal atoms i.e. a derivative crystal, or one or more compounds i.e. a co-crystal.

The term "associate", "association" or "associating" refers to a condition of proximity between a moiety (i.e. chemical entity or compound or portions or fragments thereof), and a glycosyltransferase, or parts or fragments thereof (e.g. binding sites or domains). The association may be non-covalent i.e. where the juxtaposition is energetically favored by for example, hydrogen-bonding, van der Waals, or electrostatic or hydrophobic interactions, or it may be covalent.

The term "heavy-metal atoms" refers to an atom that can be used to solve an x-ray crystallography phase problem, including but not limited to a transition element, a lanthanide metal, or an actinide metal. Lanthanide metals include elements with atomic numbers between 57 and 71, inclusive. Actinide metals include elements with atomic numbers between 89 and 103, inclusive.

A "metal cofactor" refers to a metal ion required for a glycosyltransferase to transfer the selected sugar from the sugar nucleotide donor to the acceptor. For example, the metal cofactor for N-acetylglycosyltransferase may be a divalent cation like manganese, or magnesium, and other similar atoms or metals.

The term "glycosyltransferase" refers to an enzyme that catalyzes the transfer of a single monosaccharide unit from a donor to the hydroxyl group of an acceptor substrate. The acceptor can be either a free saccharide, glycoprotein, glycolipid, or polysaccharide. The donor can be a nucleotide—sugar, or dolichol-phosphate—sugar. Glycosyltransferases show a precise specificity for both the sugar acceptor and donor and generally require the presence of a metal cofactor. The term "glycosyltransferase" also encompasses polypeptides comprising a SGC domain.

Glycosyltransferases include but are not limited to eukaryotic glycosyltransferases involved in the biosynthesis of glycoproteins, glycolipids, glycosylphosphatidylinositols and other complex glycoconjugates, and prokaryotic glycosyltransferases involved in the synthesis of carbohydrate structures of bacteria and viruses, including enzymes involved in LOS and lipopolysaccharide biosynthesis. Examples of glycosyltransferases include N-acetylglucosaminyltransferases, including N-acetylglucosaminyltransferases I through VIII involved in the biosynthesis of complex and hybrid N-glycans; UDP-N-acetylglucosamine:N-acetyl galactosamine β1,6-N-acetylglucosaminyl transferases (core 2 GlcNAc transferases); Core 3 GlcNAc transferase, Core 4 GlcNAc transferase; Core1 and Core 2 elongation glycosyltransferases involved in the biosynthesis of O-glycans and the glycosyltransferases involved in the biosynthesis of antigen determinants (blood group i and blood group I); and structurally related proteins.

The enzyme at the gateway from high-mannose structures to hybrid and complex N-glycans is UDP-

15

20

30

35

N-acetylglucosamine:α-3-D-mannoside β-1,2-N-acetylglucosaminyltransferase I [GnT I; E.C. 2.4.1.101; Harpaz and Schachter, 1980; Narasimhan et al, 1977; Stanley et al, 1975; See GenBank M61829 and M55621 (human) and M57301 (rabbit) for nucleic acid and amino acid sequences]. It transfers the first N-acetylglucosamine residue onto the high-mannose core and all other enzymes in the hybrid and complex pathway depend on its prior action (Schachter, 1986; Schachter, 1991). GnT I plays a fundamental role in mammalian development, as shown by knockout studies in mice (Ioffe, 1994; Metzler, 1994). Moreover, mutation or misregulation of several of the enzymes dependent on GnT I action are associated with human disease and metastasis (Jaeken et al, 1994,; Charuk et al, 1995; Jaeken et al, 1993; Granovsky et al, 2000; Tan et al, 1996).

Glycosyltransferases have been classified into 44 different families, based on both sequence similarity and substrate/product stereochemistry (inverting or retaining) (Campbell et al, 1997; Campbell et al, 1998; Coutinho and Henrissat, 1999). GnT I (family 13) is an inverting glycosyltransferase: the α-linked GlcNAc moiety from the UDP-α-GlcNAc donor is transferred to the 3-arm of the Man₅GlcNAc₂ acceptor, creating the β-linked GlcNAc-β-1,2-Man-R product (Reck et al, 1994).

As applied to polypeptides, the term "substantial sequence identity" means that two peptide sequences, when optimally aligned, such as by the programs GAP or BESTFIT using default gap, share at least 40%, 50%, 60%, 65%, 70%, 75%, 80%, or 85% sequence identity, preferably at least 90 percent sequence identity, more preferably at least 95 percent sequence identity or more. Preferably, residue positions which are not identical differ by conservative amino acid substitutions. For example, the substitution of amino acids having similar chemical properties such as charge or polarity are not likely to effect the properties of a protein. Examples include glutamine for asparagine or glutamic acid for aspartic acid.

The term "mutant" refers to a polypeptide that is obtained by replacing at least one amino acid residue in a native glycosyltransferase with a different amino acid residue. Mutation can also be accomplished by adding and/or deleting amino acid residues within the native glycosyltransferase or part thereof. A mutant may or may not be functional.

The term "function" refers to the ability of a modulator to enhance or inhibit the association between a glycosyltransferase and a compound, or the activity of the glycosyltransferase.

"Modulator" refers to a molecule which changes or alters the biological activity of a glycosyltransferase. A modulator may increase or decrease glycosyltransferase activity, or change its characteristics, or functional or immunological properties. It may be an inhibitor that decreases the biological or immunological activity of the protein. Modulators include but are not limited to peptides, members of random peptide libraries and combinatorial chemistry-derived molecular libraries, phosphopeptides (including members of random or partially degenerate, directed phosphopeptide libraries), antibodies, carbohydrates, nucleosides or nucleotides or parts thereof, and small organic or inorganic molecules. A modulator may be an endogenous physiological compound, or it may be a natural or synthetic compound.

The term "atomic structural coordinates" or "structural coordinates" as used herein refers to a data set that defines the three dimensional structure of a molecule or molecules (e.g. Cartesian coordinates, temperature factors, and occupancies). Structural coordinates can be slightly modified and still render nearly identical three

PCT/CA00/00725

5

10

15

20

25

30

35

dimensional structures. A measure of a unique set of structural coordinates is the root-mean-square deviation of the resulting structure. Structural coordinates that render three dimensional structures (in particular a three dimensional structure of an SGC domain) that deviate from one another by a root-mean-square deviation of less than 5 Å, 4 Å, 3 Å, 2 Å, or 1.5 Å may be viewed by a person of ordinary skill in the art as very similar.

The term "unit cell" refers to the smallest and simplest volume element (i.e. parallelpiped-shaped block) of a crystal that is completely representative of the unit of pattern of the crystal. The unit cell axial lengths are represented by a, b, and c. Those of skill in the art understand that a set of atomic coordinates determined by X-ray crystallography is not without standard error.

The term "space group" refers to the lattice and symmetry of the crystal. In a space group designation the capital letter indicates the lattice type and the other symbols represent symmetry operations that can be carried out on the contents of the asymmetric unit without changing its appearance.

The term "purified" in reference to a polypeptide, does not require absolute purity such as a homogenous preparation rather it represents an indication that the polypeptide is relatively purer than in the natural environment. Generally, a purified polypeptide is substantially free of other proteins, lipids, carbohydrates, or other materials with which it is naturally associated, preferably at a functionally significant level for example at least 85% pure, more preferably at least 95% pure, most preferably at least 99% pure. A skilled artisan can purify a polypeptide comprising a glycosyltransferase using standard techniques for protein purification. A substantially pure polypeptide comprising a glycosyltransferase will yield a single major band on a non-reducing polyacrylamide gel. The purity of the glycosyltransferase can also be determined by aminoterminal amino acid sequence analysis.

A "sugar nucleotide donor" refers to a nucleotide coupled to a selected sugar that is transferred by a glycosyltransferase to an acceptor. The selected sugar may be a monosaccharide. A suitable selected sugar includes N-acetyl glucosamine (GlcNAc). The N-acetyl glucosamine may be modified for example, the hydroxyls may be blocked with acetonide, acylated, or alkylated or substituted with other groups such as halogen. For N-acetylglucosaminyltransferases the nucleotide is preferably UDP. For other enzymes, the nucleotide may be GDP (fucosyltransferases and mannosyltransferases), or CMP (sialyltransferases). The heterocyclic amine base in the nucleotide may be modified. For example, when the base is uridine it may be modified at the C-5 or C-6 position with groups including but not limited to alkyl, aryl, and electron donating and electron withdrawing groups. The sugar in the nucleotide (e.g. ribose) may be modified at the 2' or 3' position with groups including but not limited to alkyl, aryl, and electron withdrawing groups.

"Acceptor" refers to the part of a carbohydrate structure (e.g. glycoprotein, glycolipid) where the selected sugar is transferred by the glycosyltransferase. The acceptor may comprise Man₅GlcNAc₂-.

Abbreviations for amino acid residues are the standard 3-letter and/or 1-letter codes used in the art to refer to one of the 20 common L-amino acids.

Glycosyltransferase Structures

The present invention provides a secondary or three-dimensional structure of a glycosyltransferase or part thereof (e.g. binding site or domain). In an embodiment the structure is a crystalline form. A

10

15

20

25

30

35

glycosyltransferase structure may comprise a glycosyltransferase in a unit cell. In an embodiment, a glycosyltransferase is arranged in a crystallline manner in a space group $P2_12_12_1$ so as to form a unit cell of dimensions $a=40.4\pm3.0$ Å, $b=82.4\pm3.0$ Å, $c=102.5\pm3.0$ Å, $\alpha=\beta=\gamma=90^{\circ}$, and which effectively diffracts X-rays for determination of the atomic coordinates of a glycosyltransferase. The secondary and three-dimensional structure of a preferred glycosyltransferase of the invention is illustrated by the N-acetyl glucosaminyl transferase I (GnT 1) structure specifically described herein. A glycosyltransferase structure may be defined by the structural coordinates of Tables 1, 2, 3, or 4.

A glycosyltransferase structure includes the secondary or three-dimensional structure of a native glycosyltransferase, a derivative glycosyltransferse, or a mutant glycosyltransferase. Thus, a crystalline form includes native crystals, derivative crystals, and co-crystals. The crystals generally comprise a substantially pure glycosyltransferase in crystalline form. It is understood that the glycosyltransferase structures of the invention are not limited to a naturally occurring or native glycosyltransferases but include polypeptides comprising an SGC domain, or polypeptides with substantial sequence identity to a glycosyltransferase. A glycosyltransferase structure also includes mutants of a native glycosyltransferase obtained by replacing at least one amino acid residue in a native glycosyltransferase with a different amino acid residue, or by adding or deleting amino acid residues within the native polypeptide, and having substantially the same secondary or three-dimensional structure as the native glycosyltransferase from which the mutant is derived i.e. having a set of atomic structural coordinates that have a root mean square deviation of less than or equal to about 5, 4, 3, 2, or 1.5 Å when superimposed with the atomic structure coordinates of the native glycosyltransferase from which the mutant is derived when at least 50% to 100% of the atoms of the native glycosyltransferase domain are included in the superimposition. It should be noted that the glycosyltransferase structures contemplated herein need not exhibit glycosyltransferase activity.

A derivative glycosyltransferase structure of the invention comprises a glycosyltransferase structure in association with one or more moieties that are heavy metal atoms. For example, derivative crystals of the invention generally comprise a crystalline glycosyltransferase in covalent association with one or more heavy metal atoms. The glycosyltransferase may correspond to a native or mutated glycosyltransferase. Heavy metal atoms useful for providing derivative glycosyltransferase structures include by way of example, and not limitation, gold, mercury, etc.

The invention features a glycosyltransferase structure in association with one or more moieties that are compounds (e.g. UDP-GlcNAc, uridine-ribose, phosphate-Mn²⁺, Man₅GlcNAc₂-, one or more metal cofactors). The association may be covalent or non-covalent. Crystalline forms of this type are referred to herein as co-crystals. The compound may be any organic molecule, and it may modulate the function of a glycosyltransferase by for example inhibiting or enhancing its function, or it may be an acceptor, donor, or metal cofactor for the glycosyltransferase. It is preferred that the geometry of the compound and the interactions formed between the compound and the glycosyltransferase provide high affinity binding between the two molecules.

The secondary or three-dimensional structures of the particular glycosyltransferases described herein provide useful models for the secondary or three-dimensional structures of glycosyltransferases from any

10

15

20

25

30

35

species, particularly mammalian, including bovine, ovine, porcine, murine, equine, preferably human, from any source whether natural, synthetic, semi-synthetic, or recombinant.

Binding Sites - The GnT-1 active site

N-acetylglucosaminyltransferase I catalyses the addition of a β -1,2 GlcNAc onto the α -1,3 arm of the Man₅GlcNAc₂ N-linked carbohydrate moiety. The structure has allowed the identification of the binding site of UDP-GlcNAc, identification of the reaction centre, and the development of a working model of the Man₅GlcNAc₂-acceptor binding site that correlates with biochemical reaction inhibition evidence.

The UDP-GlcNAc binding site can be subdivided into three sub sites: the uridine-ribose binding sub site, the phosphate-Mn²⁺ binding sub site, and the GlcNAc sub site.

In the uridine-ribose sub site, there are three direct hydrogen bonds between the protein and the nucleotide sugar. Asp144 interacts with the uridine N3, the His190 ND1 interacts with the uridine O2, and Asp212 binds the ribose O3. In addition, there is one water-mediated bond between Asp212 and the ribose O2. Meanwhile, the uridine base makes van der Waals interactions with Ile187, as well as the cysteine bridge between Cys115 and Cys145.

The phosphate-Mn²⁺ site is the subject of many interactions between the nucleotide sugar and protein; in fact, while the manganese co-ordination site lies on the enzyme's surface, a majority of the interactions with the phosphates come from a loop which structures itself on top of the substrate upon binding.

The protein itself has only one direct co-ordination bond to the Mn²⁺, via Asp213; since two of the six co-ordination points are taken up by the phosphate oxygens (one from each phosphate), the final three points are bound by water. These waters are then bound by the Thr315 OG, the Gly317 carbonyl oxygen, Glu211 and Asp213.

The phosphate groups make one direct hydrogen bond to Arg317NH on the protein's rigid surface, while making three hydrogen bonds with the flexible loop which rigidifies into a lid on top of the phosphate-Mn²⁺ subsite. These loop interactions are with the Val321 backbone N and the backbone N and OG of Ser322. In addition, a two-water hydrogen-bonding bridge leads to Asp116.

In contrast to the previous two sub sites, which hold the UDP-GlcNAc rigidly in place, the GlcNAc-binding sub site must allow the sugar ring enough flexibility to go through the flat penta-coordinate C1 intermediate. Three direct hydrogen bonds are made: two between the GlcNAc O4 and Asp211 and Trp290, anchoring the O4-C1 axis of the GlcNAc in place, and one between the GlcNAc O3 and Asp211, establishing the correct pucker for the sugar ring. One water bridge also exists between the sugar and the protein; the GlcNAc O6 hydrogen bonds to a water molecule held in place by the amide nitrogens of Phe289 and Trp290, along with the carbonyl oxygen of Tyr184.

The acetyl group methyl makes van der Waals contact with Leu269 and Leu331, leaving the acetyl group O7 and N2, along with the GlcNAc ring O5, unbonded. This lack of interaction may give the C2 and O5 enough flexibility to make the movements necessary for the C1 to achieve the reaction intermediate sn2 conformation.

10

15

20

25

30

35

This experimental nucleotide-sugar binding conformation has allowed the identification of the base in the reaction: Asp291 is located just over 5 Å from the GlcNAc C1, putting it in a perfect position to perform this role.

The identification of the reaction centre and binding site has provided the constraints necessary to make a theoretical model of the Man₅GlcNAc₂-acceptor binding site. The α -1,3 mannose O2 is placed between the Asp291 OD1 and the GlcNAc C1, putting it into position for the nucleophilic attack on the C1. This positioning forces the conformation of the rest of the mannose: the O3 forms hydrogen bonds to Asp291, Arg295, and a structured water held in place by Arg415; the O4 hydrogen bonds to the same structured water as the O3; and the O6 hydrogen bonds to both a UDP-GlcNAc phosphate, as well as the OG of Ser322, a phosphate-binding lid loop residue. This α -1,3 mannose orientation corresponds with biochemical evidence that all of the mannose ring's hydroxyl groups are important. In addition, this model supports the ordered-sequential reaction sequence, as the GlcNAc is buried below the Man₅GlcNAc₂, as well as further evidence that the Man₅GlcNAc₂ binding site is partially formed upon GnT-1's UDP-GlcNAc binding.

The Man₅GlcNAc₂ core mannose position is also constrained by the reaction centre location: the O4 hydrogen bonds to asp291, the ring is in van der Waals contact with Phe289 and Tyr184, and the O6 hydrogen bonds to Asp292. Again, this position supports the known biochemistry, as the O4 is important, the O2 is unimportant, and the β O1 linkage is required to allow the ring to sit against the protein surface. An α O1 would clash with the protein, and may break up the important lectin-like van der Waals interaction with the phenylalanine.

Finally, the model allows the positioning of the α -1,6 mannose, the α -1,3 and α -1,6 mannoses attached to it, and the chitobiosyl-core GlcNAc₂. The positions of these sugar rings in the model correspond with the location of conserved GnT-1 surface residues; biochemical evidence states that these sugars are less important to Man₃GlcNAc₂ binding, and thus their position is less well defined than the α -1,3 arm and core mannose.

In summary, the *N*-acetylglucosaminyltransferase I structure has allowed the exact identification of the UDP-GlcNAc binding site, along with the reaction centre, and allowed the prediction of the Man₅GlcNAc₂-acceptor binding site. This UDP-GlcNAc-bound, closed-loop GnT-1 structure is critical for the design of high-affinity inhibitors to the activity of GnT-1.

Therefore, the invention contemplates a secondary or three-dimensional structure of a binding site of a glycosyltransferase. Binding sites include the binding site for a disphosphate group of a sugar nucleotide donor, a nucleotide of a sugar nucleotide donor, a nitrogeneous heterocyclic base (preferably a pyrimidine base, more preferably uracil) of a sugar nucleotide donor, a sugar of the nucleotide of a sugar nucleotide donor, a selected sugar of a sugar nucleotide donor that is transferred to an acceptor, and/or an acceptor. A three dimensional structure of a binding site may be defined by selected atomic contacts, preferably the enzyme atomic contacts as defined in Table 5.

In an embodiment of the invention, a secondary or three-dimensional structure of a binding site of a glycosyltransferase that associates with a diphosphate of a sugar nucleotide donor (or the secondary or three-dimensional structure of a complex of the binding site with the diphosphate) is provided comprising at least

15

20

25

30

35

two or three atomic contacts of atomic interactions 8, 9, and 10 in Table 5, each atomic interaction defined therein by an atomic contact (more preferably, a specific atom where indicated) on the diphosphate group, and an atomic contact (more preferably, a specific amino acid residue where indicated) on the glycosyltransferase (i.e. enzyme atomic contact). The binding site may be defined by the enzyme atomic contacts of atomic interactions 8 and 9; 8 and 10; 9 and 10; or 8, 9, and 10 in Table 5. Preferably, the binding site is defined by the atoms of the enzyme atomic contacts having the structural coordinates for the atoms listed in Table 1, 2, 3, or 4.

In an embodiment of the invention, a secondary or three-dimensional structure of a binding site of a glycosyltransferase that associates with a heterocyclic amine base (preferably uracil) of a sugar nucleotide donor (or the secondary or three-dimensional structure of a complex of the binding site with a heterocyclic amine base) is provided comprising at least two, three, or four atomic contacts of atomic interactions 1, 2, 3, 4, and 5 in Table 5, each atomic interaction defined therein by an atomic contact (more preferably, a specific atom where indicated) on the heterocyclic amine base, and an atomic contact (more preferably, a specific amino acid residue where indicated) on the glycosyltransferase (i.e. enzyme atomic contact).. The binding site may be defined by the enzyme atomic contacts of atomic interactions 1, 2, and 3; 2, 3, and 4; 3, 4, and 5; 1, 2, and 4; 1, 2, and 5; 1, 3, and 4; 1, 3, and 5; 2, 3, and 5; 2, 4, and 5; 1, 2, 3, and 4; 1, 2, 3, and 5; 2, 3, 4, and 5; 1, 3, 4, and 5; or 1, 2, 3, 4, and 5 in Table 5. Preferably, the binding site is defined by the atoms of the enzyme atomic contacts having the structural coordinates for the atoms listed in Table 1, 2, 3, or 4.

In an embodiment of the invention, a secondary or three-dimensional structure of a binding cavity of a glycosyltransferase that associates with the sugar of the nucleotide (preferably ribose) of a sugar nucleotide donor (or a secondary or three-dimensional structure of a complex of the binding site with the sugar) is provided comprising the atomic contacts of atomic interactions 6 and 7 in Table 5, each atomic interaction defined therein by an atomic contact (more preferably, a specific atom where indicated) on the sugar, and an atomic contact (more preferably, a specific amino acid residue where indicated) on the glycosyltransferase (i.e. enzyme atomic contact). The binding site may be defined by the enzyme atomic contacts of atomic interactions 6 and 7 in Table 5. Preferably, the binding site is defined by the atoms of the enzyme atomic contacts in the binding site having the structural coordinates for the atoms listed in Table 1, 2, 3, or 4.

In an embodiment of the invention, a secondary or three-dimensional structure of a binding cavity of a glycosyltransferase that associates with a selected sugar (GlcNAc) of a sugar nucleotide donor (or a secondary or three-dimensional structure of a complex of the binding site with the selected sugar) is provided comprising at least two, three, four, five, six, seven, or eight atomic contacts selected from the atomic contacts of atomic interactions 14, 15, 16, 17, 18, 19, 20, and 21 in Table 5, each atomic interaction defined therein by an atomic contact (more preferably, a specific atom where indicated) on the selected sugar, and an atomic contact (more preferably, a specific amino acid residue where indicated) on the glycosyltransferase (i.e. enzyme atomic contact). The binding site may be defined by the enzyme atomic contacts of atomic interactions 14, 18, and 19; 14, 20, and 21; 14, 15, 16, and 17; 18, 19, 20, and 21; and 14 through 21 in Table 5. Preferably, the binding site is defined by the atoms of the enzyme atomic contacts in the binding site having the structural coordinates for the atoms listed in Table 1, 2, 3, or 4.

10

15

20

25

30

35

In an embodiment of the invention, a secondary- or three-dimensional structure of a binding cavity of a glycosyltransferase that associates with a nucleotide (preferably UDP) of a sugar nucleotide donor (or a secondary or three-dimensional structure of a complex of the binding site and nucleotide) is provided comprising at least two, three, four, five, six, seven, or eight, nine or ten atomic contacts of atomic interactions 1, 2, 3, 4, 5, 6, 7, 8, 9, and 10 in Table 5, each atomic interaction defined therein by an atomic contact (more preferably, a specific atom where indicated) on the nucleotide, and an atomic contact (more preferably, a specific amino acid residue where indicated) on the glycosyltransferase (i.e. enzyme atomic contact). The binding site may be defined by enzyme atomic contacts of atomic interactions 1, 2, 6, 7, 8, 9, and 10; 3, 4, 6, 7, 8, 9, and 10; and 1 through 10 in Table 5. Preferably, the binding site is defined by the atoms of the enzyme atomic contacts in the binding site having the structural coordinates for the atoms listed in Table 1, 2, 3, or 4.

In an embodiment of the invention, a secondary- or three-dimensional structure of a binding cavity of a glycosyltransferase that associates with a sugar nucleotide donor (e.g. UDP-GlcNAc) (or a secondary or three-dimensional structure of a complex of the binding site with the sugar nucleotide donor) is provided comprising at least two, three, four, five, six, seven, eight, nine, ten, eleven, twelve, thirteen, fourteen, fifteen, sixteen, seventeen, eighteen, nineteen, twenty, or twenty-one atomic contacts of atomic interactions 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, and 21 in Table 5, each atomic interaction defined therein by an atomic contact (more preferably, a specific atom where indicated) on the sugar nucleotide donor, and an atomic contact (more preferably, a specific amino acid residue where indicated) on the glycosyltransferase (i.e. enzyme atomic contact). The binding site may be defined by enzyme atomic contacts of atomic interactions 1,2, 6, 7, 8, 9, 10, 14, 15, 18, and 20; 1, 2, 6, 7, 8, 9, 10, 14, 16, 17, 19, and 21; 3, 4, 6, 7, 8, 9, 10, 14, 15, 18, and 20; 3, 4, 6, 7, 8, 9, 10, 14, 16, 17, 19, 21; or 1 through 21 listed in Table 5. Preferably the binding site is defined by the atoms of the enzyme atomic contacts in the binding site having the structural coordinates for the atoms listed in Table 1, 2, 3, or 4.

A glycosyltransferase structure may be characterized by a "loop" structure. The loop folds on top of the pyrophosphate after the sugar nucleotide donor associates with the active site of the glycosyltransferase. Molecules that associate with the loop are highly specific inhibitors of the enzymes. In an embodiment of the invention, a secondary or three-dimensional structure of a loop structure of a glycosyltransferase that binds a pyrophosphate of a sugar nucleotide donor is provided comprising at least two, three, four, five, six, or seven atomic contacts of atomic interactions 11, 12, 13, 23, 24, 25, and 27 in Table 5. The binding site may be defined by enzyme atomic contacts 11, 12, and 13; 11, 12, 13 and 27; 23, 24, 25, and 27; or 11, 12, 13, 23, 24, 25, and 27 in Table 5. Preferably, the binding site is defined by the atoms of the enzyme atomic contacts in the binding site have the structural coordinates for the atoms listed in Table 1, 2, 3, or 4.

A secondary or three-dimensional structure of a binding site of a glycosyltransferase that associates with an Man₅GlcNAc₂-acceptor (or a secondary or three dimensional structure of a complex of the binding site with the acceptor) is also provided comprising at least two, three, four, five, or six atomic contacts of atomic interactions 22, 23, 24, 25, 26, and 27 in Table 5, each atomic interaction defined therein by an atomic contact (more preferably, a specific atom where indicated) on the acceptor, and an atomic contact (more preferably, a

10

15

20

25

30

35

specific amino acid residue where indicated) on the glycosyltransferase (i.e. enzyme atomic contact). The binding site may be defined by enzyme atomic contacts of atomic interactions 22, 23, and 24; 23, 24, and 25; 24, 25, and 26; 25, 26, and 27; 22, 23, 24, and 25; 23, 24, 25, and 26; 24, 25, 26, and 27; 22, 23, 24, 25, and 26; 23, 24, 25, 26, and 27; and 22 through 27 in Table 5. Preferably, the binding site is defined by the atoms of the enzyme atomic contacts in the binding site having the structural coordinates for the atoms listed in Table 1, 2, 3, or 4.

Method for Preparing Crystal Forms of a Glycosyltransferase

The invention also features a method for creating crystalline glycosyltransferase structures described herein. The method may utilize a polypeptide comprising a glycosyltransferase described herein to form a crystal. A polypeptide used in the method may be chemically synthesized in whole or in part using techniques that are well-known in the art. Alternatively, methods are well known to the skilled artisan to construct expression vectors containing the native or mutated glycosyltransferase coding sequence and appropriate transcriptional/translational control signals. These methods include *in vitro* recombinant DNA techniques, synthetic techniques, and *in vivo* recombination/genetic recombination. See for example the techniques described in Sambrook et al. (Molecular Cloning: A Laboratory Manual, 2nd Edition, Cold Spring Harbor Laboratory press (1989)), and other laboratory textbooks. (See also Sarker et al, Glycoconjugate J. 7:380, 1990; Sarker et al, Proc. Natl. Acad, Sci. USA 88:234-238, 1991, Sarker et al, Glycoconjugate J. 11: 204-209, 1994; Hull et al, Biochem Biophys Res Commun 176:608, 1991 and Pownall et al, Genomics 12:699-704, 1992).

Crystals are grown from an aqueous solution containing the purified glycosyltransferase polypeptide by a variety of conventional processes. These processes include batch, liquid, bridge, dialysis, vapor diffusion, and hanging drop methods. (See for example, McPherson, 1982 John Wiley, New York; McPherson, 1990, Eur. J. Biochem. 189: 1-23; Webber. 1991, Adv. Protein Chem. 41:1-36). Generally, the native crystals of the invention are grown by adding precipitants to the concentrated solution of the glycosyltransferase polypeptide. The precipitants are added at a concentration just below that necessary to precipitate the protein. Water is removed by controlled evaporation to produce precipitating conditions, which are maintained until crystal growth ceases.

In an embodiment of the invention, the method comprises mixing a volume of a glycosyltransferase solution (e.g. 5 mg glycosyltransferase /ml to 15 mg glycosyltransferase /ml, preferably 10 mg/ml) with a reservoir solution; and equilibrating against the reservoir solution under vapour-diffusion conditions.

It will be appreciated that the crystallization conditions can be varied and such variations can be used alone or in combination.

Derivative crystals of the invention can be obtained by soaking native crystals in a solution containing salts of heavy metal atoms. A complex of the invention can be obtained by soaking a native crystal in a solution containing a compound that binds the glycosyltransferase, or they can be obtained by co-crystallizing the glycosyltransferase polypeptide in the presence of one or more compounds that bind to the glycosyltransferase.

10

15

20

25

30

35

Once the crystal is grown it can be placed in a glass capillary tube and mounted onto a holding device connected to an X-ray generator and an X-ray detection device. Collection of X-ray diffraction patterns are well documented by those skilled in the art (See for example, Ducruix and Geige, 1992, IRL Press, Oxford, England). A beam of X-rays enter the crystal and diffract from the crystal. An X-ray detection device can be utilized to record the diffraction patterns emanating from the crystal. Suitable devices include the Marr 345 imaging plate detector system with an RU200 rotating anode generator.

Methods for obtaining the three dimensional structure of the crystalline form of a molecule or complex are described herein and known to those skilled in the art (see Ducruix and Geige). Generally, the x-ray crystal structure is given by the diffraction patterns. Each diffraction pattern reflection is characterized as a vector and the data collected at this stage determines the amplitude of each vector. The phases of the vectors may be determined by the isomorphous replacement method where heavy atoms soaked into the crystal are used as reference points in the X-ray analysis (see for example, Otwinowski, 1991, Daresbury, United Kingdom, 80-86). The phases of the vectors may also be determined by molecular replacement (see for example, Naraza, 1994, Proteins 11:281-296). The amplitudes and phases of vectors from the crystalline form of a glycosyltransferase, e.g. an N-acetylglucosaminyltransferase I, determined in accordance with these methods can be used to analyze other crystalline glycosyltransferases, particularly those with an SGC domain.

The unit cell dimensions and symmetry, and vector amplitude and phase information can be used in a Fourier transform function to calculate the electron density in the unit cell i.e. to generate an experimental electron density map. This may be accomplished using the PHASES package (Furey, 1990). Amino acid sequence structures are fit to the experimental electron density map (i.e. model building) using computer programs (e.g. Jones, TA. et al, Acta Crystallogr A47, 100-119, 1991). This structure can also be used to calculate a theoretical electron density map. The theoretical and experimental electron density maps can be compared and the agreement between the maps can be described by a parameter referred to as R-factor. A high degree of overlap in the maps is represented by a low value R-factor. The R-factor can be minimized by using computer programs that refine the structure to achieve agreement between the theoretical and observed electron density map. For example, the XPLOR program, developed by Brunger (1992, Nature 355:472-475) can be used for model refinement.

A three dimensional structure of the molecule or complex may be described by atoms that fit the theoretical electron density characterized by a minimum R value. Files can be created for the structure that defines each atom by coordinates in three dimensions.

Identification of Homologues

The knowledge of a glycosyltransferase structure of the invention enables one skilled in the art to identify homologues of glycosyltransferases. This is achieved by searches of three-dimensional databases. Since structural folds are conserved to a greater extent than sequence, one may identify homologues with very little sequence identity or similarity. Programs that provide this type of database searching are known in the art and include Dali. The structural coordinates of a protein structure are submitted and the program performs a multiple structural alignment with proteins in the protein data bank. Homologues identified in accordance with the present invention may be used in the methods of the invention described herein.

Methods for Determining Secondary or Three Dimensional Structures

The structure coordinates of a glycosyltransferase structure described herein can be used as a model for determining the secondary or three-dimensional structures of additional native or mutated glycosyltransferases with unknown structure, as well as the structures of co-crystals of glycosyltransferases with compounds such as acceptors, donors (e.g. UDP-GlcNAc or analogues thereof), and modulators (e.g. stimulators or inhibitors). The structure coordinates and models of a glycosyltransferase structure can also be used to determine solution-based structures of native or mutant glycosyltransferases.

Secondary or three-dimensional structure may be determined by applying the structural coordinates of a glycosyltransferase structure to other data such as an amino acid sequence, X-ray crystallographic diffraction data, or nuclear magnetic resonance (NMR) data. Homology modeling, molecular replacement, and nuclear magnetic resonance methods using these other data sets are described below.

Homology modeling (also known as comparative modeling or knowledge-based modeling) methods develop a three dimensional model from a polypeptide sequence based on the structures of known proteins (e.g. native or mutated glycosyltransferases). In the present invention the method utilizes a computer representation of a glycosyltransferase structure, preferably a three dimensional structure of an Nacetylglucosaminyltransferase I, or a complex of same, a computer representation of the amino acid sequence of a polypeptide with an unknown structure (additional native or mutated glycosyltransferases, or polypeptides comprising an SGC domain), and standard computer representations of the structures of amino acids. The method in particular comprises the steps of; (a) identifying structurally conserved and variable regions in the known structure; (b) aligning the amino acid sequences of the known structure and unknown structure (c) generating coordinates of main chain atoms and side chain atoms in structurally conserved and variable regions of the unknown structure based on the coordinates of the known structure thereby obtaining a homology model; and (d) refining the homology model to obtain a three dimensional structure for the unknown structure. This method is well known to those skilled in the art (Greer, 1985, Science 228, 1055; Bundell et al 1988, Eur. 172, 513; Knighton 1992, Science J. Biochem. al., http://biochem.vt.edu/courses/modeling/homology.htn). Computer programs that can be used in homology modeling are Quanta and the Homology module in the Insight II modeling package distributed by Molecular or MODELLER (Rockefeller University, www.iucr.ac.uk/sinris-top/logical/prg-Simulations Inc. modeller.html).

In step (a) of the homology modeling method, the known glycosyltransferase structure (e.g. structure of the N-acetylglucosaminyltransferase I) is examined to identify the structurally conserved regions (SCRs) from which an average structure, or framework, can be constructed for these regions of the protein. Variable regions (VRs), in which known structures may differ in conformation, also must be identified. SCRs generally correspond to the elements of secondary structure, such as alpha-helices and beta-sheets, and to ligand- and substrate-binding sites (e.g. acceptor and donor binding sites). The VRs usually lie on the surface of the proteins and form the loops where the main chain turns.

Many methods are available for sequence alignment of known structures and unknown structures. Sequence alignments generally are based on the dynamic programming algorithm of Needleman and Wunsch

15

20

25

30

35

[J. Mol. Biol. 48: 442-453, 1970]. Current methods include FASTA, Smith-Waterman, and BLASTP, with the BLASTP method differing from the other two in not allowing gaps. Scoring of alignments typically involves construction of a 20x20 matrix in which identical amino acids and those of similar character (i.e., conservative substitutions) may be scored higher than those of different character. Substitution schemes which may be used to score alignments include the scoring matrices PAM (Dayhoff et al., Meth. Enzymol. 91: 524-545, 1983), and BLOSUM (Henikoff and Henikoff, Proc. Nat. Acad. Sci. USA 89: 10915-'0919, 1992), and the matrices based on alignments derived from three-dimensional structures including that of Johnson and Overington (JO matrices) (J. Mol. Biol. 233: 716-738, 1993).

Alignment based solely on sequence may be used; however, other structural features also may be taken into account. In Quanta, multiple sequence alignment algorithms are available that may be used when aligning a sequence of the unknown with the known structures. Four scoring systems (i.e. sequence homology, secondary structure homology, residue accessibility homology, CA-CA distance homology) are available, each of which may be evaluated during an alignment so that relative statistical weights may be assigned.

When generating coordinates for the unknown structure, main chain atoms and side chain atoms, both in SCRs and VRs need to be modeled. A variety of approaches known to those skilled in the art may be used to assign coordinates to the unknown. In particular, the coordinates of the main chain atoms of SCRs will be transferred to the unknown structure. VRs correspond most often to the loops on the surface of the polypeptide and if a loop in the known structure is a good model for the unknown, then the main chain coordinates of the known structure may be copied. Side chain coordinates of SCRs and VRs are copied if the residue type in the unknown is identical to or very similar to that in the known structure. For other side chain coordinates, a side chain rotamer library may be used to define the side chain coordinates. When a good model for a loop cannot be found fragment databases may be searched for loops in other proteins that may provide a suitable model for the unknown. If desired, the loop may then be subjected to conformational searching to identify low energy conformers if desired.

Once a homology model has been generated it is analyzed to determine its correctness. A computer program available to assist in this analysis is the Protein Health module in Quanta which provides a variety of tests. Other programs that provide structure analysis along with output include PROCHECK and 3D-Profiler [Luthy R. et al, Nature 356: 83-85, 1992; and Bowie, J.U. et al, Science 253: 164-170, 1991]. Once any irregularities have been resolved, the entire structure may be further refined. Refinement may consist of energy minimization with restraints, especially for the SCRs. Restraints may be gradually removed for subsequent minimizations. Molecular dynamics may also be applied in conjunction with energy minimization.

Molecular replacement involves applying a known structure to solve the X-ray crystallographic data set of a polypeptide of unknown structure (e.g. native or mutated glycosyltransferases). The method can be used to define the phases describing the X-ray diffraction data of a polypeptide of unknown structure when only the amplitudes are known. Commonly used computer software packages for molecular replacement are X-PLOR (Brunger 1992, Nature 355: 472-475), AMoRE (Navaza, 1994, Acta Crystallogr. A50:157-163), the CCP4 package (Collaborative Computational Project, Number 4, "The CCP4 Suite: Programs for Protein Crystallography", Acta Cryst., Vol. D50, pp. 760-763, 1994), and the MERLOT package (P.M.D. Fitzgerald,

10

15

20

25

30

35

- 22 -

J. Appl. Cryst., Vol. 21, pp. 273-278, 1988). It is preferable that the resulting structure not exhibit a root-mean-square deviation of more than 3 Å.

Molecular replacement computer programs generally involve the following steps: (1) determining the number of molecules in the unit cell and defining the angles between them (self rotation function); (2) rotating the known structure (e.g. glycosyltransferase) against diffraction data to define the orientation of the molecules in the unit cell (rotation function); (3) translating the known structure in three dimensions to correctly position the molecules in the unit cell (translation function); (4) determining the phases of the X-ray diffraction data and calculating an R-factor calculated from the reference data set and from the new data wherein an R-factor between 30-50% indicates that the orientations of the atoms in the unit cell have been reasonably determined by the method; and (5) optionally, decreasing the R-factor to about 20% by refining the new electron density map using iterative refinement techniques known to those skilled in the art (refinement).

In an embodiment of the invention, a method is provided for determining three dimensional structures of polypeptides with unknown structure (e.g. additional native or mutated glycosyltransferases) by applying the structural coordinates of a glycosyltransferase structure to provide an X-ray crystallographic data set for a polypeptide of unknown structure, and (b) determining a low energy conformation of the resulting structure.

The structural coordinates of a glycosyltransferase structure may be applied to nuclear magnetic resonance (NMR) data to determine the three dimensional structures of polypeptides (e.g. additional native or mutated glycosyltransferases, or polypeptides comprising an SGC domain). (See for example, Wuthrich, 1986, John Wiley and Sons, New York: 176-199; Pflugrath et al., 1986, J. Molecular Biology 189: 383-386; Kline et al., 1986 J. Molecular Biology 189:377-382). While the secondary structure of a polypeptide may often be determined by NMR data, the spatial connections between individual pieces of secondary structure are not as readily determined. The structural coordinates of a polypeptide defined by X-ray crystallography can guide the NMR spectroscopist to an understanding of the spatial interactions between secondary structural elements in a polypeptide of related structure. Information on spatial interactions between secondary structural elements can greatly simplify Nuclear Overhauser Effect (NOE) data from two-dimensional NMR experiments. In addition, applying the structural coordinates after the determination of secondary structure by NMR techniques simplifies the assignment of NOE's relating to particular amino acids in the polypeptide sequence and does not greatly bias the NMR analysis of polypeptide structure.

In an embodiment, the invention relates to a method of determining three dimensional structures of polypeptides with unknown structures, preferably a native or mutated glycosyltransferases or polypeptides comprising an SGC domain, by applying the structural coordinates of a glycosyltransferase structure of the invention to nuclear magnetic resonance (NMR) data of the unknown structure. This method comprises the steps of: (a) determining the secondary structure of an unknown structure using NMR data; and (b) simplifying the assignment of through-space interactions of amino acids. The term "through-space interactions" defines the orientation of the secondary structural elements in the three dimensional structure and the distances between amino acids from different portions of the amino acid sequence. The term "assignment" defines a method of analyzing NMR data and identifying which amino acids give rise to signals in the NMR spectrum.

Identification of Modulators of Glycosyltransferases

Modulators (e.g. inhibitors) of a glycosyltransferase (or a binding site or domain thereof) may be designed and identified that may modify the inappropriate activity of a glycosyltransferase involved in a clinical disorder. The rational design and identification of modulators of glycosyltransferases can be accomplished by utilizing the atomic structural coordinates that define a glycosyltransferase structure, or a part thereof. Structure-based modulator design identification methods are powerful techniques that can involve searches of computer data bases containing a variety of potential modulators and chemical functional groups. (See Kuntz et al., 1994, Acc. Chem. Res. 27:117; Guida, 1994, Current Opinion in Struc. Biol. 4: 777; and Colman, 1994, Current Opinion in Struc. Biol. 4: 868, for reviews of structure-based drug design and identification; and Kuntz et al 1982, J. Mol. Biol. 162:269; Kuntz et al., 1994, Acc. Chem. Res. 27: 117; Meng et al., 1992, J. Compt. Chem. 13: 505; Bohm, 1994, J. Comp. Aided Molec. Design 8: 623 for methods of structure-based modulator design).

The glycosyltransferase structures, and parts thereof described herein, and the structures of other polypeptides determined by the homology modeling, molecular replacement, and NMR techniques described herein can also be applied to modulator design and identification methods.

Modulators of glycosyltransferases may be identified by docking the computer representation of compounds from a data base of molecules. Data bases which may be used include ACD (Molecular Designs Limited), NCI (National Cancer Institute), CCDC (Cambridge Crystallographic Data Center), CAST (Chemical Abstract Service), Derwent (Derwent Information Limited), Maybridge (Maybridge Chemical Company Ltd), Aldrich (Aldrich Chemical Company), DOCK (University of California in San Francisco), and the Directory of Natural Products (Chapman & Hall). Computer programs such as CONCORD (Tripos Associates) or DB-Converter (Molecular Simulations Limited) can be used to convert a data set represented in two dimensions to one represented in three dimensions.

The computer programs may comprise the following steps:

- (a) docking a computer representation of a structure of a compound into a computer representation of an active-site (e.g. binding site or SGC domain) of a glycosyltransferase defined in accordance with the invention using the computer program, or by interactively moving the representation of the compound into the representation of the active-site;
- (b) characterizing the geometry and the complementary interactions formed between the atoms of the active-site and the compound; optionally
- (c) searching libraries for molecular fragments which can fit into the empty space between the compound and active site and can be linked to the compound; and
- (d) linking the fragments found in (c) to the compound and evaluating the new modified compound.

 Methods are also provided for identifying a potential modulator of a glycosyltransferase function by docking a computer representation of a compound with a computer representation of a structure of a glycosyltransferase that is defined by the binding sites, atomic interactions, atomic contacts, or atomic structural coordinates described herein. In an embodiment the method comprises the following steps:

10

15

20

25

30

35

- (a) docking a computer representation of a compound from a computer data base with a computer representation of a selected site (e.g. the sugar nucleotide donor or acceptor binding site, or SGC domain) on a glycosyltransferase structure defined in accordance with the invention to obtain a complex;
- (b) determining a conformation of the complex with a favourable geometric fit and favourable complementary interactions; and
- (c) identifying compounds that best fit the selected site as potential modulators of the glycosyltransferase.

"Docking" refers to a process of placing a compound in close proximity with an active site of a polypeptide (i.e. a glycosyltransferase), or a process of finding low energy conformations of a compound/polypeptide complex (i.e. compound/glycosyltransferase complex).

Examples of other computer programs that may be used for structure-based modulator design are CAVEAT (Bartlett et al., 1989, in "Chemical and Biological Problems in Molecular Recognition", Roberts, S.M. Ley, S.V.; Campbell, N.M. eds; Royal Society of Chemistry: Cambridge, pp 182-196); FLOG (Miller et al., 1994, J. Comp. Aided Molec. Design 8:153); PRO Modulator (Clark et al., 1995 J. Comp. Aided Molec. Design 9:13); MCSS (Miranker and Karplus, 1991, Proteins: Structure, Fuction, and Genetics 8:195); and, GRID (Goodford, 1985, J. Med. Chem. 28:849).

In an embodiment of the invention, a method is provided for identifying potential modulators of glycosyltransferase function. The method utilizes the structural coordinates of a glycosyltransferase three dimensional structure, or binding site or domain thereof. The method comprises the steps of (a) generating a computer representation of a glycosyltransferase structure, preferably an N-acetylglucosaminyltransferase I structure, and docking a computer representation of a compound from a computer data base with a computer representation of an active site (e.g. sugar nucleotide donor or acceptor binding site) of the glycosyltransferase to form a complex; (b) determining a conformation of the complex with a favourable geometric fit or favorable complementary interactions; and (c) identifying compounds that best fit the glycosyltransferase active-site as potential modulators of glycosyltransferase function. The initial glycosyltransferase structure may or may not have compounds bound to it. A favourable geometric fit occurs when the surface areas of a compound in a compound-glycosyltransferase complex is in close proximity with the surface area of the active-site of the glycosyltransferase without forming unfavorable interactions. A favourable complementary interaction occurs where a compound in a compound-glycosyltransferase complex interacts by hydrophobic, aromatic, ionic, or hydrogen donating and accepting forces, with the active-site of a glycosyltransferase without forming unfavorable interactions. Unfavourable interactions may be steric hindrance between atoms in the compound and atoms in the glycosyltransferase active-site.

In another embodiment, potential modulators are identified utilizing a glycosyltransferase structure with or without compounds bound to it. The method comprises the steps of (a) modifying a computer representation of a glycosyltransferase (e.g. an N-acetylglucosaminyltransferase I) having one or more compounds bound to it, where the computer representations of the compound or compounds and glycosyltransferase are defined by atomic structural coordinates; (b) determining a conformation of the

10

15

20

25

30

35

complex with a favorable geometric fit and favorable complementary interactions; and (c) identifying the compounds that best fit the glycosyltransferase active site as potential modulators. A computer representation may be modified by deleting or adding a chemical group or groups. Computer representations of the chemical groups can be selected from a computer database.

Another way of identifying potential modulators is to modify an existing modulator in a polypeptide active-site. The computer representation of modulators can be modified within the computer representation of a glycosyltransferase active-site. This technique is described in detail in Molecular Simulations User Manual, 1995 in LUDI. The computer representation of a modulator may be modified by deleting a chemical group or groups, or by adding a chemical group or groups. After each modification to a compound, the atoms of the modified compound and active-site can be shifted in conformation and the distance between the modulator and the active site atoms may be scored on the basis of geometric fit and favourable complementary interactions between the molecules. Compounds with favourable scores are potential modulators.

Compounds designed by modulator building or modulator searching computer programs may be screened to identify potential modulators. Examples of such computer programs include programs in the Molecular Simulations Package (Catalyst), ISIS/HOST, ISIS/BASE, and ISIS/DRAW (Molecular Designs Limited), and UNITY (Tripos Associates). A building program may be used to replace computer representations of chemical groups in a compound complexed with a glycosyltransferase with groups from a computer data base. A searching program may be used to search computer representations of compounds from a computer database that have similar three dimensional structures and similar chemical groups as a compound that binds to a glycosyltransferase. The programs may be operated on the structure of the active-site (e.g. binding sites, or SGC domain) of a glycosyltransferase structure, preferably an N-acetylglucosaminyltransferase I.

A typical program may comprise the following steps:

- (a) mapping chemical features of a compound such as by hydrogen bond donors or acceptors, hydrophobic/lipophilic sites, positively ionizable sites, or negatively ionizable sites;
- (b) adding geometric constraints to selected mapped features;
- (c) searching data bases with the model generated in (b).

In an embodiment of the invention a method of identifying potential modulators of a glycosyltransferase, preferably an N-acetylglucosaminyltransferase I, is provided using the three dimensional conformation of the glycosyltransferase in various modulator construction or modulator searching computer programs on compounds complexed with the glycosyltransferase. The method comprises the steps of (a) generating a computer representation of one or more compounds complexed with a glycosyltransferase; (b) (i) searching a data base for a compound with a similar geometric structure or similar chemical groups to the generated compounds using a computer program that searches computer representations of compounds from a database that have similar three dimensional structures and similar chemical groups, or (ii) replacing portions of the compounds complexed with the glycosyltransferase with similar chemical structures (i.e. nearly identical shape and volume) from a database using a compound construction computer program that replaces computer

10

15

20

25

30

35

representations of chemical groups with groups from a computer database, where the representations of the compounds are defined by structural coordinates.

A compound that interacts with a glycosyltransferase or selected binding sites or domains thereof identified using a method of the invention may be used as a modulator of any glycosyltransferase or composition bearing the interacting binding site or domains. Therefore, the invention features a modulator of a glycosyltransferase identified by a method of the invention.

The invention further contemplates a method for designing potential inhibitors of a glycosyltransferase comprising the step of using the structural coordinates of a sugar nucleotide donor or acceptor or component thereof, or an acceptor or components thereof, defined in relation to its spatial association with a glycosyltransferase structure or a binding site or domain thereof, to generate a compound that is capable of associating with the glycosyltransferase or binding site or domain thereof.

In an embodiment of the invention, a method is provided for designing potential inhibitors of a glycosyltransferase comprising the step of using the structural coordinates of uridine, uracil, or UDP listed in Table 3 [ATOMS 2828-2835 (uracil); 2836-2844 (ribose); and 2845-2851 (diphosphate)] to generate a compound for associating with the active site of a glycosyltransferase. The following steps are employed in a particular method of the invention: (a) generating a computer representation of uridine, uracil, or UDP, defined by its structural coordinates listed in Table 3; (b) searching for molecules in a data base that are structurally or chemically similar to the defined uridine, uracil, or UDP, using a searching computer program, or replacing portions of the compound with similar chemical structures from a database using a compound building computer program.

In another embodiment of the invention, a method is provided for designing potential inhibitors of a glycosyltransferase comprising the step of using the structural coordinates of UDP-GlcNAc listed in Table 3 (ATOMS 2813-2851), to generate a compound for associating with the active site of a glycosyltransferase. The following steps are employed in a particular method of the invention: (a) generating a computer representation of UDP-GlcNAc defined by its structural coordinates listed in Table 3; and (b) searching for molecules in a data base that are structurally or chemically similar to the defined UDP-GlcNAc using a searching computer program, or replacing portions of the compound with similar chemical structures from a database using a compound building computer program.

In another embodiment of the invention, a method is provided for designing potential inhibitors of a glycosyltransferase comprising the step of using the structural coordinates of a Man₅GlcNAc₂ acceptor listed in Table 4, to generate a compound for associating with the active site of a glycosyltransferase. In Table 4, the coordinates of a Man₅GlcNAc₂ acceptor are listed as ATOMS 3043 through 3126 where the mannose and GlcNAc residues designated as X, Y, U, V, W, Z, and A have the following positions in the acceptor:

$$Man\alpha 1-6$$
 (U)
$$Man\alpha 1-6(W)$$

$$Manβ (Y) - GlcNAc(Z) - GlcNAc(A)$$

$$Man\alpha 1-3 (X)$$

15

20

25

30

35

The following steps are employed in a particular method of the invention: (a) generating a computer representation of a Man₅GlcNAc₂ acceptor defined by its structural coordinates listed in Table 4; and (b) searching for molecules in a data base that are structurally or chemically similar to the defined Man₅GlcNAc₂ acceptor using a searching computer program, or replacing portions of the compound with similar chemical structures from a database using a compound building computer program.

It will be appreciated that a modulator of a glycosyltransferase may be identified by generating an actual three-dimensional model of a binding cavity, synthesizing a compound, and examining the components to find whether the required interaction occurs.

Potential modulators of glycosyltransferases identified using the above-described methods may be prepared using methods described in standard reference sources utilized by those skilled in the art. For example, organic compounds may be prepared by organic synthetic methods described in references such as March, 1994, Advanced Organic Chemistry: Reactions, Mechanisms, and Structure, New York, McGraw Hill.

The invention also relates to a potential modulator identified by the methods of the invention. In particular, classes of modulators of glycosyltransferases are provided that are based on the three-dimensional structure of a sugar nucleotide donor, or component thereof, or acceptor, defined in relation to the sugar nucleotide donor's or acceptor's spatial association with a glycosyltransferase structure. Modulators of glycosyltransferases comprise a compound comprising the structure of uracil, uridine, ribose, pyrophosphate, or UDP, and having one or more, preferably all, of the structural coordinates of uracil, uridine, ribose, pyrophosphate, or UDP of Table 3 [ATOMS 2828-2835 (uracil); 2836-2844 (ribose); and 2845-2851 (diphosphate)]. In an embodiment, modulators are provided comprising the structure of UDP-GlcNAc and having one or more, preferably all, of the structural coordinates of UDP-GlcNAc of Table 3 (ATOMS 2813-2851). Functional groups in the uracil, uridine, ribose, pyrophosphate, UDP, or UDP-GlcNAc modulators may be substituted with, for example, alkyl, alkoxy, hydroxyl, aryl, cycloalkyl, alkenyl, alkynyl, thiol, thioalkyl, thioaryl, amino, or halo, or they may be modified using techniques known in the art.

Modulators are also contemplated that comprise the structure of a Man₅GlcNAc₂ acceptor for a glycosyltransferase with the structural coordinates of Man₅GlcNAc₂ acceptor listed in Table 4 (ATOMS 3043 through 3126). Functional groups in an acceptor structure may be substituted with, for example, alkyl, alkoxy, hydroxyl, aryl, cycloalkyl, alkenyl, alkynyl, thiol, thioalkyl, thioaryl, amino, or halo, or they may be modified using techniques known in the art.

The invention contemplates all optical isomers and racemic forms of the modulators of the invention.

Compositions and Methods of Treatment

The modulators of the invention may be used to modulate the biological activity of a glycosyltransferase in a cell, including modulating a pathway in a cell regulated by the glycosyltransferase or modulating a glycosyltransferase with inappropriate activity in a cellular organism. In addition, a glycosyltransferase structure of the invention may be used to devise protocols to modulate the biological activity of a glycosyltransferase in a cell.

Cellular assays, as well as animal model assays in vivo, may be used to test the activity of a potential modulator of a glycosyltransferase as well as diagnose a disease associated with inappropriate

10

15

20

25

30

35

glycosyltransferase activity. *In vivo* assays are also useful for testing the bioactivity of a potential modulator designed by the methods of the invention.

The modulators (e.g. inhibitors) identified using the methods of the invention may be useful in the treatment and prophylaxis of tumor growth and metastasis of tumors. Anti-metastatic effects of inhibitors can be demonstrated using a lung colonization assay. For example, melanoma cells treated with an inhibitor may be injected into mice and the ability of the melanoma cells to colonize the lungs of the mice may be examined by counting tumor nodules on the lungs after death. Suppression of tumor growth in mice by the inhibitor administered orally or intravenously may be examined by measuring tumor volume.

An inhibitor identified using the invention may have particular application in the prevention of tumor recurrence after surgery i.e. as an adjuvant therapy.

An inhibitor may be especially useful in the treatment of various forms of neoplasia such as leukemias, lymphomas, melanomas, adenomas, sarcomas, and carcinomas of solid tissues in patients. In particular, inhibitors can be used for treating malignant melanoma, pancreatic cancer, cervico-uterine cancer, ovarian cancer, cancer of the kidney such as metastatic renal cell carcinoma, stomach, lung, rectum, breast, bowel, gastric, liver, thyroid, head and neck cancers such as unresectable head and neck cancers, lymphangitis carcinamatosis, cancers of the cervix, breast, salivary gland, leg, tongue, lip, bile duct, pelvis, mediastinum, urethra, bronchogenic, bladder, esophagus and colon, non-small cell lung cancer, and Kaposi's Sarcoma which is a form of cancer associated with HIV-infected patients with Acquired Immune Deficiency Syndrome (AIDS). The inhibitors may also be used for other anti-proliferative conditions such as bacterial and viral infections, in particular AIDS.

An inhibitor identified in accordance with the present invention may be used to treat immunocompromised subjects. For example, they may be used in a subject infected with HIV, or other viruses or infectious agents including bacteria, fungi, and parasites, in a subject undergoing bone marrow transplants, and in subjects with chemical or tumor-induced immune suppression.

Inhibitors may be used as hemorestorative agents and in particular to stimulate bone marrow cell proliferation, in particular following chemotherapy or radiotherapy. The myeloproliferative activity of an inhibitor of the invention may be determined by injecting the inhibitor into mice, sacrificing the mice, removing bone marrow cells and measuring the ability of the inhibitor to stimulate bone marrow proliferation by directly counting bone marrow cells and by measuring clonogenic progenitor cells in methylcellulose assays. The inhibitors can also be used as chemoprotectants, and in particular to protect mucosal epithelium following chemotherapy.

An inhibitor identified in accordance with the invention also may be used as an antiviral agent in particular on membrane enveloped viruses such as retroviruses, influenza viruses, cytomegaloviruses and herpes viruses. An inhibitor may also be used to treat bacterial, fungal, and parasitic infections. For example, a small molecule inhibitor can be used to prevent or treat infections caused by the following: Neisseria species such as Neisseria meningitidis, and N. gonorrheae; Chlamydia species such as Chlamydia pneumoniae, Chlamydia psittaci, Chlamydia trichomatis; Escherichia coli, Haemophilus species such as Haemophilus influenza; Yersinia enterocolitica; Salmonella species such as S.typhimurium; Shigella species such as Shigella

10

15

20

25

30

35

flexneri; Streptococcus species such as S.agalactiae and S. pneumoniae; Bacillus species such as Bacillus subtilis; Branhamella catarrhalis; Borrelia burgdorfer; Pseudomonas aeruginosa; Coxiella burnetti; Campylobacter species such as C.hyoilei; Helicobacter pylori; and, Klebsiella species such as Klebsiella pneumoniae.

An inhibitor may also be used in the treatment of inflammatory diseases such as rheumatoid arthritis, asthma, inflammatory bowel disease, and atherosclerosis.

An inhibitor may also be used to augment the anti-cancer effects of agents such as interleukin-2 and poly-IC, to augment natural killer and macrophage tumoricidal activity, induce cytokine synthesis and secretion, enhance expression of LAK and HLA class I specific antigens; activate protein kinase C, stimulate bone marrow cell proliferation including hematopoietic progenitor cell proliferation, and increase engraftment efficiency and colony-forming unit activity, to confer protection against chemotherapy and radiation therapy (e.g. chemoprotective and radioprotective agents), and to accelerate recovery of bone marrow cellularity particularly when used in combination with chemical agents commonly used in the treatment of human diseases including cancer and acquired immune deficiency syndrome (AIDS). For example, an inhibitor can be used as a chemoprotectant in combination with anti-cancer agents including doxorubicin, 5-fluorouracil, cyclophosphamide, and methotrexate, and in combination with isoniazid or NSAID.

The present invention thus provides a method for treating the above-mentioned conditions in a subject comprising administering to a subject an effective amount of a modulator of the invention. The invention also contemplates a method for stimulating or inhibiting tumor growth or metastasis in a subject comprising administering to a subject an effective amount of a modulator of the invention.

The invention still further relates to a pharmaceutical composition which comprises a glycosyltransferase structure of the invention or a part thereof (e.g. an active site, a phosphate-binding loop lid, an SGC domain, DxD motif,), or a modulator of the invention in an amount effective to regulate one or more of the above-mentioned conditions (e.g. tumor growth or metastasis) and a pharmaceutically acceptable carrier, diluent or excipient.

The compositions of the invention are administered to subjects in a biologically compatible form suitable for pharmaceutical administration in vivo. By "biologically compatible form suitable for administration in vivo" is meant a form of the active ingredient to be administered in which any toxic effects are outweighed by the therapeutic effects of the active ingredient. The term "subject" is intended to include mammals and includes humans, dogs, cats, mice, rats, and transgenic species thereof. Administration of a therapeutically active amount of the pharmaceutical compositions of the present invention is defined as an amount effective, at dosages and for periods of time necessary to achieve the desired result. For example, a therapeutically active amount of a modulator of the invention may vary according to factors such as the condition, age, sex, and weight of the individual. Dosage regimes may be adjusted to provide the optimum therapeutic response. For example, several divided doses may be administered daily or the dose may be proportionally reduced as indicated by the exigencies of the therapeutic situation.

10

15

20

25

30

35

The active compound may be administered in a convenient manner such as by injection (subcutaneous, intravenous, etc.), oral administration, inhalation, transdermal application, or intracerebral administration.

A pharmaceutical composition of the invention can be administered to a subject in an appropriate carrier or diluent, co-administered with enzyme inhibitors or in an appropriate carrier such as microporous or solid beads or liposomes. The term "pharmaceutically acceptable carrier" as used herein is intended to include diluents such as saline and aqueous buffer solutions. Liposomes include water-in-oil-in-water emulsions as well as conventional liposomes (Strejan et al., (1984) J. Neuroimmunol 7:27). The active compound may also be administered parenterally or intraperitoneally. Dispersions can also be prepared in glycerol, liquid polyethylene glycols, and mixtures thereof and in oils. Under ordinary conditions of storage and use, these preparations may contain a preservative to prevent the growth of microorganisms. Depending on the route of administration, the active compound may be coated to protect the compound from the action of enzymes, acids, and other natural conditions which may inactivate the compound.

Therapeutic administration of polypeptide modulators may also be accomplished using gene therapy. A nucleic acid including a promoter operatively linked to a heterologous polypeptide may be used to produce high-level expression of the polypeptide in cells transfected with the nucleic acid. DNA or isolated nucleic acids may be introduced into cells of a subject by conventional nucleic acid delivery systems. Suitable delivery systems include liposomes, naked DNA, and receptor-mediated delivery systems, and viral vectors such as retroviruses, herpes viruses, and adenoviruses.

The following non-limiting examples are illustrative of the present invention:

EXAMPLE 1

Crystals of alpha-1,3-mannosyl-glycoprotein beta-1,2-N-acetylglucosaminyltransferase (GnT-1) were grown by the vapour-diffusion method from protein drops containing 10 mg/ml GnT-1, 10 mM MES buffer, pH 5.5, 270 mM KCL, 2-5 mM MnCl₂, and 10 mM UDP-GlcNAc, mixed with, and equilibrated against, 15-25% polyethylene glycol 8000, 100 mM Tris buffer, pH 7.9, 0 to 5% glycerol, and 0 to 10% isopropanol. Plate-like crystals grew within a few days, in space group P2₁2₁2₁ (a= 40.4 Å, b= 82.4Å, c= 102.5Å, α = β = γ =90°), with one molecule in the asymmetric unit, and 40% solvent content. Data was collected from the crystals flash-frozen in a 100K N₂ stream, after a ten-minute wash with 21% polyethylene glycol 8000, 15% glycerol, and 100 mM Tris buffer, pH 7.9.

Atomic structural coordinates of an N-acetylglucosaminyltransferase I are set out in Table 1. Atomic coordinates of an N-acetylglucosaminyltransferase I with bound MeHg are set out in Table 2. The atomic structural coordinates of a rabbit N-acetylglucosaminyltransferase I bound to UDP-GlcNAc and a manganese 2+ ion are shown in Table 3. Atomic structural coordinates of an N-acetylglucosaminyltransferase I with acceptor are shown in Table 4. Figures 1 to 26, 28 to 30, and 32 to 40B illustrate glycosyltransferase structures, or binding sites or domains thereof.

10

15

20

25

30

35

EXAMPLE 2

The x-ray crystal structure of a soluble fragment containing the catalytic domain of a rabbit (Oryctolagus cuniculus) GnT I was determined at 1.4 Å resolution. The 342 residue catalytic domain of GnT I was expressed as an N-terminal histidine-tagged fusion protein (Sarker et al, Glycoconjugate J. 15:193-197, 1998), using the baculovirus/Sf9 system in a 3.5 litre bioreactor. The protein was purified using a CM HyperD F column, followed by a Ni-affinity column. The histidine tag was removed by enterokinase cleavage. Crystals were grown using the hanging-drop vapor diffusion method, from drops containing 10 mg/ml protein, 10 mM MES pH 6.5, 250 mM KCL, 2 mM MnCl₂, and 10 mM UDP-GlcNAc, and wells containing 17.5%-19.5% PEG 8000, 5% glycerol, and 100 mM Tris-HCl pH 7.9 Native and two-wavelength mercury-derivative data were collected using frozen crystals on the F2 beam line at the Cornell High Energy Synchrotron Source. The crystals grow in space group $P2_12_12_1$, with cell parameters a = 40.4 Å, b=82.4 Å, c = 102.5 Å. The structure was solved using the multiwavelength anomalous dispersion technique. GnTI contains both an eight-stranded mixed beta-sheet, flanked by six alpha helices, and a four-stranded mixed beta sheet, backed by three alpha helices. The structure reveals that the catalytic domain has dimensions 54 Å x 52 Å x 37 Å, with a large pocket on one face capable of holding both the UDP-GlcNAc donor and the Man₅Gn₂ acceptor. Sequence comparison shows that residues found in the pocket are very well conserved among GnT I sequences from different species. The pocket is flanked by a loop, not seen in the electron density map, which plays a role in either catalysis or substrate binding.

EXAMPLE 3

X-ray Crystal Structure of N-Acetylglucosaminyltransferase I: Structure, Mechanism, and the SGC Superfamily

Overall Structure

The catalytic fragment of rabbit GnT I (residues 106-447; Sarkar et al, 1998) was crystallized in the presence of UDP-GlcNAc and Mn²⁺, and solved by the multi-wavelength anomalous diffraction (MAD) phasing method using a methylmercury chloride derivative (Table 6). In particular, crystals were grown using the hanging drop vapor diffusion method, by mixing equal 1.5 µl volumes of protein solution (10 mg/ml GnT I catalytic fragment, 10 mM MES buffer, pH 5.5, 270 mM KCl, 2 mM MnCl₂ and 10 mM UDP-GlcNAc) with well solution (15-25% polyethylene glycol 8000, 100 mM Tris buffer, pH 7.9, and 5% glycerol), and equilibrating against 1 ml of the well solution. A mercury derivative was obtained by soaking a crystal in well solution containing 20 mM MeHgCl. All data was collected using Quantum 4 charge-coupled device detectors on the F2 beamline of the Cornell High Energy Synchrotron Source, using crystals flash-frozen in the 100 K N₂ stream. Data were integrated, scaled, and reduced with DENZO and SCALEPACK (Otwinowski and Minor, 1997). The mercury position was identified with SOLVE (Terwilliger and Berendzen, 1999), and refined using SHARP (La Fortelle and Bricogne, 1997). Solvent flattening and histogram matching were

10

15

20

25

30

35

performed using DM (Cowtan, 1994). The resultant experimental map was traced using the program O (Jones et al, 1991), and the model refined with multiple rounds of manual rebuilding using O and OOPS2 (Kleywegt and Jones, 1996), alternated with simulated annealing and positional and B-factor refinement using CNS (Brunger et ak, 1998). The initial model was also refined against the "native" and "complex" data in a similar fashion.

In total, the structure was refined against data sets from 3 different crystals. Of these, no bound nucleotide sugar or Mn²⁺ ion was observed in the mercury "derivative" (refined at 1.4 Å resolution) nor in the structure refined against the data set that was termed "native" (1.5 Å resolution). Unlike that found in these *apo* structures, both components were seen in the "complex" (1.8 Å resolution). Since the native and derivative data sets were collected on samples that had aged before the x-ray data were collected, it was assumed that in these cases the UDP-GlcNAc had been hydrolysed.

GnT I is a two-domain protein, with overall dimensions of approximately 65 Å × 40 Å × 50 Å (Figure 25). The N-terminal domain (domain 1: residues 106-317) is an eight-stranded mixed β -sheet (β 1- β 8), flanked by six α -helices (α 1- α 6) and a small two-stranded antiparallel β -sheet (β 4' and β 8'). The smaller C-terminal domain (domain 2: residues 354-447) is a four-stranded mixed β -sheet (β 9, β 10, β 13 and β 14), flanked by three α -helices (α 7- α 9) and a short β -finger (β 11 and β 12). The two domains are connected by a linker region (residues 331 to 353) which wraps halfway around domain 1 before starting the first helix of domain 2. The ~1050 Ų interface between domain 1 and domain 2 is quite hydrophilic, and contains 20 bridging water molecules. The residues buried in the interface on domain 1 are 53% polar, while those in domain 2 are 36% polar.

The α -helices $\alpha 3$, $\alpha 5$ and $\alpha 6$ sit on "top" of the central β -sheet and create a pocket for the nucleotide-sugar and oligosaccharide acceptor. Electrostatic potential analysis shows that this pocket is largely acidic, in contrast to the rest of the protein surface, which is primarily positively charged. The nucleotide sugar itself sits between helicies $\alpha 3$ and $\alpha 6$ and β -strands $\beta 1$, $\beta 2$ and $\beta 4$. The topology and structure of β -strands $\beta 1$ to $\beta 4$, and helices $\alpha 1$ to $\alpha 3$, are similar to those of the corresponding elements in domains possessing the Rossman fold, however, the orientation of the nucleotide sugar with respect to these elements is not.

In the native and derivative structures, in which UDP-GlcNAc and the Mn²⁺ ion were not observed, there is also no electron density for the 13-residue loop (residues 318-330) adjacent to the nucleotide-sugar binding site. The "missing loop" is presumed to be disordered in these crystals, as SDS-PAGE analysis of washed crystals showed the protein to be intact. These residues are structured in the complex, and are found to form a flap that partially covers the UDP-GlcNAc moiety. Although structured by UDP-GlcNAc binding only the tip of the loop makes direct interactions with it. Approximately 50 Å² is buried between the tip of the loop and the UDP-GlcNAc phosphates. Structuring the loop also buries ~600 Å² of protein surface adjacent to the nucleotide-sugar binding site. In these crystals the active site and the loop itself are exposed to a large solvent channel, and are not involved in crystal contacts. Aside from structuring the loop, there is no major conformational change associated with UDP-GlcNAc binding. The native and complex structures show a root-mean-squared-deviation (rmsd) of 0.28 Å, based on the α-carbon atoms of residues 106 to 317 and 331 to 447. The Nucleotide Sugar and Metal Binding Sites

10

15

20

25

30

35

As shown by the structure of the complex, the UDP-GlcNAc is bound in the *anti* conformation. The uracil ring is sandwiched between I187 and the C115-C145 cysteine bridge, and its N3 and O2 make key hydrogen bond interactions with D144 and H190, respectively (Table 7 and Figure 33A). Moreover, its C5 is in van der Waals contact with V321, part of the loop structured by UDP-GlcNAc binding. The ribose O2' and O3' atoms make a water-mediated and a direct hydrogen bond, respectively, with the carboxyl side chain of D212. This Asp is the middle residue in the DXD motif common to a number of glycosyltransferases, as will be discussed in detail below.

The Mn²⁺ ion shows an octahedral geometry coordinated by six "inner-sphere" oxygen atoms (Table 7 and Figure 33B). The α - and β -phosphate of UDP-GlcNAc each contribute a coordinating oxygen atom, as do three water molecules. These water molecules are, in turn, hydrogen bonded to "outer sphere" protein residues E211, D213, T315 and G317. The remaining high-energy inner sphere metal ligand is provided by the carboxyl group of D213 -- the only direct interaction with the protein. As such, it seems that GnT I does not have an independent metal binding site capable of binding Mn²⁺ in the absence of UDP-GlcNAc. In addition to coordinating the Mn²⁺ ion, the phosphates make direct interactions with the protein. The α -phosphate makes a salt bridge with R117 and a hydrogen bond to the amide nitrogen of V321, and the β -phosphate hydrogen bonds to the hydroxyl group of S322. These interactions with V321 and S322 are an important component of the UDP-GlcNAc dependent structuring of the loop. Overall, the phosphates are in a conformation typical of divalent metal-bound nucleotides (Black et al, 1994).

Finally, the GlcNAc moiety itself makes several interactions with the protein (Table 7 and Figure 33C). The vicinal O3 and O4 hydroxyls are hydrogen bonded with the carboxyl group of E211 in a fashion seen in many lectin-carbohydrate complexes (Vyas, 1991). The O4 hydroxyl appears to play a central role, as it also makes a strong hydrogen bond with W290. The O6 hydroxyl is hydrogen bonded to a tightly bound water molecule seen in both the *apo* and complex structures. van der Waals interactions are also important, most notably between the *N*-acetyl methyl group and the side chains of L269 and L331.

The Glycosyltransferase DxD Motif

The DxD motif has been identified in many glycosyltransferase families and is thought to be involved in Mn²⁺ ion binding. The motif contains two Asp residues and is typically flanked by apolar residues (hhhhDxDxh) (Wiggins and Munro, 1998). (See Figures 27 and 31 for DxD motif alignments.) Site-directed mutagenesis has shown that both Asp's are required for yeast α-1,3-mannosyltransferase activity (Wiggins and Munro, 1998). In GnT I, the motif is present in a modified form (²¹¹EDD²¹³), and with L214 forms the i to i+3 residues of a type 1 β-turn connecting β-strands β4 and β4' (Figure 39). As such, the highly conserved acidic residues are directed toward the same face of the turn. The fact that β4 runs through the core of the protein is consistent with the observed presence of several apolar residues on the N-terminal side of the motif.

The interactions with UDP-GlcNAc and the Mn²⁺ ion illustrate the importance of the motif. As discussed above, the second conserved Asp (D213) makes the only direct interaction with the bound Mn²⁺ ion. In addition, it makes a hydrogen bond with one of the metal coordinating water molecules, which itself is hydrogen bonded to the first conserved Asp (E211). Overall, these residues are conformationally constrained by the well-defined octahedral geometry characteristic of Mn²⁺ ion coordination. Since the phosphates of the

nucleotide sugar also coordinate the manganese ion, it serves to define the relative orientation of the nucleotide sugar and the conserved acid residues. In the case of GnT I this positions the GlcNAc moiety of the donor sugar for interaction with the first residue of the motif. In other sugar nucleoside diphosphate/Mn²⁺-dependent glycosyltransferases, the first Asp of the DxD motif would be expected to play a carbohydrate-binding role, regardless of the nucleotide sugar type/linkage. It is well known that Asp is a key residue in carbohydrate binding proteins, and is thus well suited for such a role. Clearly, the well-conserved DxD motif does not simply serve to bind metal, but rather coordinates both the Mn²⁺ ion and the sugar moiety of the donor.

Reaction Mechanism

5

10

15

20

25

30

35

Catalysis by inverting glycosyltransferases is believed to involve a general base, such as Asp or Glu, which serves to assist in the deprotonation of the nucleophilic hydroxyl of the acceptor. In GnT I the only residue capable of playing this role is D291, 4.7 Å away from the GlcNAc C1 (Figure 33C). The structure shows that the acceptor will be able to approach the UDP-GlcNAc donor, so as to permit in-line nucleophilic attack and inversion of stereochemistry at the GlcNAc C1. Furthermore, the Mn²⁺ ion is disposed to pull developing negative charge away from the β-phosphate of the UDP leaving group (a role which may be aided by R117) (in which the hydration state of the ion is likely to play a crucial role (Cowan, 1998; Dudev et al, 1999).

Mechanistically, the reaction is thought to involve an oxocarbenium ion intermediate, similar to that proposed for glycosidases. Since glycosidases reduce the activation energy of the hydrolysis reaction by binding their substrates in a distorted conformation the GlcNAc ring conformation was examined for a similar effect. However, there was no evidence of significant distortion suggesting that the UDP-GlcNAc is bound in a low energy conformation: the sugar ring is a standard 4C_1 chair, and the glycosydic linkage is in an allowed conformation (Petrova et al 1999). As such, the UDP-GlcNAc is conceivably no more susceptible to nucleophilic attack by water than it would be in solution. Presumably, the activation energy for catalysis is derived from acceptor binding.

Loop Structuring and the Acceptor Binding Pocket

Comparison of the *apo* and complex structures shows that UDP-GlcNAc binding structures the 318-330 loop, forming a flap that partly covers the UDP-GlcNAc (Figure 40A). As discussed above V321 and S322, at the tip of the loop, make hydrogen bonds to the α - and β -phosphates of the UDP-GlcNAc. Residues 320-323 form a type IV turn, while the C-terminal residues 324-330 make one complete turn of an α -helix. The loop folds upon itself, burying residue F327 against R318 and the non-loop residues T315, L331 and K332. The only conformational changes other than structuring the loop itself are a peptide flip (F316-G317) and a reorientation of the T315 side chain. These changes are critical as the G317 carbonyl and the T315 hydroxyl are repositioned to make hydrogen bonds with two of the Mn²⁺ ion coordinating water molecules (see Figure 40A and Figure 33B).

As shown in Figure 40B, loop structuring creates a deep pocket, terminating over the proposed catalytic base (D291) and the GlcNAc moiety. The pocket itself can accommodate only a single monosaccharide residue of the Man₅GlcNAc₂ acceptor. One complete side of this pocket is formed by the loop structured upon UDP-GlcNAc binding. As a result two loop residues (S322 and F326), fully conserved among

active GnT I sequences, are presented to the acceptor binding pocket (Figure 40B). To explore the potential roles played by these and other residues in the binding pocket, a mannose residue was modeled into the site. With the attacking O2 hydroxyl positioned between the Asp 291 OE2 and the UDP-GlcNAc C1, only one general orientation leads to reasonable steric and chemical interactions with the protein. In this orientation, the exocyclic C6 hydroxymethyl group of the mannose interacts with S322 and F326, while the O3 and O4 point toward D291, R295 and R415.

The importance of the mannose O3, O4 and O6 predicted by this model is consistent with substrate studies using synthetic analogues of the trimannose core of the acceptor (Moller, 1992; Reck, 1995). In these studies it was further shown that even in the trimannose core, the known specificity of GnT I for the Man α 1,3-arm over that of the Man α 1,6-arm of the acceptor is preserved. This specificity is presumably dictated by interactions involving the β -mannose O4, the only other trisaccharide hydroxyl group found to be important. Extending the model to include all residues of the trimannose core (in its solution conformation) (Brisson and Cowen, 1983), the β -mannose O4 is positioned to interact with either D291 or D292. Similar interactions cannot be made when the 6-arm mannose is positioned in the binding pocket. Presumably the incoming nucleophile and associated binding energy serve to drive the reaction toward the transition state and ultimately product formation.

Enzyme Kinetics

10

15

20

25

30

35

Analysis has shown that GnT I proceeds through an ordered sequential Bi Bi kinetic mechanism (Nishikawa et al, 1988). The enzyme first binds Mn²⁺/UDP-GlcNAc and then the Man₅GlcNAc₂ acceptor; the carbohydrate product is released first, followed by UDP. The GnT I structures provide an explanation for these observations. Since UDP-GlcNAc binding is required to structure the loop, and create the acceptor binding site, it is clear that the nucleotide sugar must bind first. Once catalysis has occurred, the UDP product cannot maintain the loop in its structured conformation, the acceptor binding pocket is destroyed, and the oligosaccharide product released. UDP, which is bound more weakly to GnT I than UDP-GlcNAc, is then free to diffuse out of the binding site, to be replaced by a fresh molecule of UDP-GlcNAc. By destroying the acceptor/product binding pocket, these kinetics also ensure that the enzyme is not strongly inhibited by the oligosaccharide product.

The structure also shows that GnT I does not itself have a Mn²⁺ ion binding site — there is only a single direct protein-metal interaction. The Mn²⁺ ion is clearly more fully coordinated by UDP-GlcNAc, and positioned on the surface of the protein by virtue of its interactions with the nucleotide sugar. This mode of binding may also be an important determinant of how the enzyme releases its products. In the absence of an independent metal binding site, the UDP-Mn²⁺ complex would be free to dissociate from the enzyme surface, once catalysis has occurred.

The suggestion that bound UDP cannot support loop structuring stems from an analysis of the loop's interactions with UDP-GlcNAc in the complex. As discussed earlier, two residues (V321 and S322) at the tip of the loop form hydrogen bonds with oxygen atoms from the two phosphates. The loop's interactions are not otherwise very extensive, altogether burying only 50 Å^2 of the bound nucleotide sugar. Once the bond between the GlcNAc C1 and the β -phosphate oxygen is broken, the terminal phosphate acquires an additional

negative charge and presumably greater mobility (the latter enhanced by the lack of an independent Mn²⁺ ion binding site). Together, these effects would be expected to disrupt the ability of the phosphates to structure the loop. As such, it would seem that the structured loop can be thought of as a sensor for the integrity of the GlcNAc-phosphate linkage, thereby regulating formation and destruction of the acceptor/product binding site.

The SGC Domain

5

10

15

20

25

30

35

Analysis shows that the structure of domain 1 of GnT I is very similar to that of the *B. subtilis* glycosyltransferase spsA (residues 2-217) (Charnock and Davies, 1999). It possesses an identical topology, and all of the major secondary structural elements characterizing the domain are found in both structures (Figure 29). The domain is also found, with some modification in secondary structure (the topology remains the same), in β4Gal-T1 (residues 180-346) (Gastinel et al, 1999), and GlmU (residues 4-227, Figure 30) (Brown et al, 1999). Structural alignment using the program DALI, yields Z-scores of 15.7, 10.6 and 9.8, with spsA, β4Gal-T1 and GlmU, respectively. The very strong structural similarity between GnT I domain 1 and spsA suggests the existence of a canonical core domain, the SGC domain (spsA GnT I core domain), represented, in these four structures.

Despite the structural similarity shown by these enzymes, they do not show significant sequence similarity. Even with a knowledge of the structural alignment, GnT I shows only 10%, 12%, and 7% sequence identity with spsA, β 4Gal-Tl, and GlmU, respectively. These levels of identity make it difficult, if not impossible, to establish whether or not these enzymes stem from a common ancestor. Analysis of residues critical for function may, however, shed light on this question. The position of the UDP moiety in the GnT I complex is virtually identical to that found in the spsA complex (Figure 29) and is also very similar to that seen in the β 4Gal-Tl and GlmU complexes. Moreover, the DxD motif is present in all four of these proteins and forms a perfectly superimposable type 1 β -turn in each case. Finally, at position D291, the proposed catalytic base in GnT I, both glycosyltransferases, spsA (D191) and β 4Gal-Tl (D318), also possess Asp residues. Not only are these key residues and functional features identical in these structures, they are found at the same position on the structural/topological framework. The low sequence identity, common fold, and related functional features define the SGC superfamily, whose members are therefore likely to share a common evolutionary origin (Murzin et al, 1995).

The SGC Superfamily

The lack of sequence identity between glycosyltransferases with different specificities has lead to a classification that now includes 44 glycosyltransferase families. GnT I, for example, is in a family of its own, and a Position-Specific Iterated BLAST (PSI-BLAST) search, using the GnT I sequence, identifies no other related glycosyltransferases. Based on the knowledge that the GnT I SGC domain is structurally similar to spsA, an attempt was made at finding sequence similarity between these and other glycosyltransferases, thereby extending the SGC superfamily. The spsA sequence, coming from a much larger glycosyltransferase family, containing many divergent sequences, provides a more robust profile, and it was used to seed a PSI-BLAST search (Altschul et al, 1997). The search was able to identify similarity between spsA (family 2) and rabbit GnT I (family 13). It also showed similarity between spsA and the β-1,4-GalNAc transferases (family 12), the ceramide glucosyltransferases (family 21) and the polypeptide GalNAc transferases (family 27);

10

15

25

30

35

neither \(\beta 4 \text{Gal-T1} \) (family 7), nor GlmU appeared in the searches.

To further explore possible relationships among the glycosyltransferase families, protein threading was used to determine the compatibility of a number of glycosyltransferase sequences with the SGC domain. Using the program THREADER 2, a single arbitrarily-selected sequence from each of the 27 glycosyltransferase families described by Campbell *et al.* (Campbell et al, 1998; Campbell et al, 1997) were run against a database of 1900 structures, which included the SGC domain of GnT I, spsA, β4Gal-T1 and GlmU. In both the normal and randomized test scores, the selected sequence from family 2, family 7, and family 13 ranked first or second against the SGC domain of spsA, β4Gal-T1 and GnT I, respectively, as would be expected. The sequence from family 3, family 6, family 16 and family 26 also ranked first or second in the two tests; sequences from several other families also received high scores. These results, and those based on PSI-BLAST searching, suggest that the SGC domain is widely represented among different families and includes both inverting and retaining glycosyltransferases.

Table 8 shows protein threading results. Proteins from different families were threaded against a THREADER 2 database containing 1900 protein folds, including GnT I, spsA, GlmU, and β4Gal-TI. The folds were sorted on the basis of their filtered combined energy Z-scores. When a GTCD-1-containing fold was one of the top thirty hits, out of 1900, then the top thirty hits were rerun with a randomization test of fifty shuffled-sequence threadings for each fold, to give a combined energy shuffled Z-score. A correct prediction should score well in both tests. Note that not only are inverting families represented, but so are retaining glycosyltransferases.

20 Conclusion

The structure of the catalytic domain of GnT I has provided the basis for its Mn²⁺/UDP-GlcNAc binding properties, as well as insight into both its catalytic and kinetic mechanisms. The structure of the DxD motif shows that the first conserved residue plays a role in binding the donor sugar, while the second coordinates the essential Mn²⁺ ion. These roles are likely to be conserved in other DxD-containing glycosyltransferases, regardless of donor specificity. In addition, structural analysis has defined the SGC domain, seen in GnT I, spsA, β4Gal-T1 and GlmU. Sequence analysis and protein threading show that the SGC domain is contained in enzymes from several of the existing inverting and retaining glycosyltransferase families. Among these are enzymes involved in mammalian N- and O-linked oligosaccharide biosynthesis, bacterial cell wall production, and the synthesis of glycogen, chitin and cellulose. Together, they constitute the SGC superfamily.

Having illustrated and described the principles of the invention in a preferred embodiment, it should be appreciated to those skilled in the art that the invention can be modified in arrangement and detail without departure from such principles. All modifications coming within the scope of the following claims are claimed.

Table 8

Protein threading results. Proteins from different families were threaded against a THREADER 2 database containing 1900 protein folds, including GnT I, spsA, GlmU, and β 4Gal-T1. The folds were sorted on the basis of their filtered combined energy Z-scores. When a GTCD-1-containing fold was one of the top thirty hits, out of 1900, then the top thirty hits were rerun with a randomization test of fifty shuffled-sequence threadings for each fold, to give a combined energy shuffled Z-score. A correct prediction should score well in both tests.

Family	Class	Protein (GenBank Gl number)	Top GTCD-1- containing Hit	Z-score (rank)	Randomization Test Z-score (rank)
1	Inverting	Petunia x hybrida UDP-rhamnose anthocyanidin-3- glucosiderhamnosyltransferase (397567)	β4Gal-T1	2.33 (10)	3.28 (8)

WE CLAIM:

- 1. A secondary or three-dimensional structure of a purified glycosyltransferase when it associates with a nucleotide sugar donor, acceptor, or metal cofactor.
- 2. A secondary or three-dimensional structure of a purified glycosyltransferase in association with a moiety.
- 3. A secondary or three-dimensional structure as claimed in claim 2, wherein the moiety is a nucleotide sugar donor, acceptor, metal cofactor, or heavy metal atom.
- 4. A secondary or three-dimensional structure of a glycosyltransferase as defined in any of the preceding claims that is a crystalline form.
- 5. A secondary or three-dimensional structure of a glycosyltransferase as defined in any of the preceding claims, wherein the glycosyltransferase is an N-acetylglucosaminyltransferase.
- 6. A secondary or three-dimensional structure of a glycosyltransferase as defined in any of the preceding claims having one or both of the following characteristics:
 - (a) an N-terminal domain comprising an eight-stranded mixed β -sheet flanked by six helices, and a small two-stranded antiparallel β -sheet; and
 - (b) a C-terminal domain comprising a four-stranded mixed β -sheet flanked by three α -helices and a short β -finger.
- 7. A secondary or three-dimensional structure of a glycosyltransferase as defined in claim 6 further characterized by the N-terminal domain and C-terminal domain being connected by a linker region which wraps halfway around the N-terminal domain before starting the first helix of the C-terminal domain.
- 8. A secondary or three-dimensional structure of a glycosyltransferase as defined in any of the preceding claims having the structural coordinates of a glycosyltransferase listed in Table 1, 2, 3, or 4.
- 9. A secondary or three-dimensional structure of a glycosyltransferase in association with a sugar nucleotide donor having the structural coordinates of a glycosyltransferase and a sugar nucleotide donor listed in Table 3.
- A secondary or three-dimensional structure of a glycosyltransferase in association with an acceptor having the structural coordinates of a glycosyltransferase and an acceptor listed in Table 4.
- 11. A crystalline form of a glycosyltransferase having a unit cell with dimensions of $a = 40.4 \pm 3 \text{ Å}$, $b=82.4 \pm 3 \text{ Å}$, and $c = 102.5 \pm 3 \text{ Å}$.
- 12. A crystalline form of an N-acetylglucosaminyltransferase having the structural coordinates listed in Table 1, 2, 3, or 4, and a unit cell with dimensions of $a = 40.4 \pm 3 \text{ Å}$, $b=82.4 \pm 3 \text{ Å}$, and $c = 102.5 \pm 3 \text{ Å}$.
- 13. A crystalline form as claimed in claim 11 or 12 further characterized by the parameters, diffraction statistics, and/or refinement statistics in Table 6.

- 14. A secondary or three-dimensional structure of a binding site of a secondary or three-dimensional structure of a glycosyltransferase as defined in any of the preceding claims.
- 15. A secondary or three-dimensional structure of a binding site as claimed in claim 14 wherein the binding site is defined by its association with one or more of a disphosphate group of a sugar nucleotide donor, a nucleotide of a sugar nucleotide donor, a sugar of a nucleotide of a sugar nucleotide donor, a selected sugar of a sugar nucleotide donor that is transferred to an acceptor, and/or an acceptor.
- 16. A secondary or three-dimensional structure of a binding site of a glycosyltransferase as defined in the preceding claims wherein the binding site is also defined by the atomic interactions of Table 5, preferably the enzyme atomic contacts.
- 17. A secondary or three-dimensional structure of a binding site of a glycosyltransferase as defined in the preceding claims wherein the binding site is defined by atomic interactions 1 to 5; 6 and 7; 8, 9 and 10; 1 to 13; 14 to 21; 22 to 27; 1 to 13; 1 to 21; or 11, 12, 13, and 27 listed in Table 5, or the enzyme atomic contacts for these atomic interactions listed in Table 5.
- 18. A secondary or three-dimensional structure of an spsA GnT 1 core (SGC) domain of a secondary or three-dimensional structure of a glycosyltransferase as defined in any of the preceding claims.
- 19. A secondary or three-dimensional structure of an SGC domain as claimed in claim 18 characterized by an eight-stranded mixed β -sheet, flanked by six helices, and a small two-stranded antiparallel β -sheet.
- 20. A modulator of the activity of a glycosyltransferase derived from a secondary or three-dimensional structure as claimed in any of the preceding claims.
- 21. A method of determining three-dimensional structures of polypeptides with unknown structure comprising the step of applying the structural coordinates of Table 1, 2, 3, or 4.
- 22. A method for identifying a potential modulator of a glycosyltransferase, or binding sites or domains thereof, comprising the step of using the structural coordinates of Table 1, 2, 3, or 4 that define a glycosyltransferase or binding sites or domains thereof, to computationally evaluate a test compound for its ability to associate with the glycosyltransferase, binding sites or domains thereof, wherein a test compound that associates is a potential modulator of a glycosyltransferase.
- 23. A method for identifying a modulator of a glycosyltransferase by determining binding interactions between a test compound and secondary or three-dimensional structures of binding sites as defined in any of the preceding claims comprising:
 - (a) generating the binding sites on a computer screen;
 - (b) generating a test compound with its spatial structure on the computer screen; and
 - (c) testing to determine whether the test compound binds to a selected number of binding
- 24. A method for identifying a potential modulator of a glycosyltransferase function comprising the steps:

- (a) docking a computer representation of a compound from a computer data base with a computer representation of a secondary or three-dimensional structure of a glycosyltransferase or a binding site as defined in any of the preceding claims, to obtain a complex;
- (b) determining a conformation of the complex with a favourable geometric fit and favourable complementary interactions; and
- (c) identifying compounds that best fit the selected site as potential modulators of the glycosyltransferase.
- 25. A method for identifying a potential modulator of a glycosyltransferase function comprising the steps:
 - (a) modifying a computer representation of a compound complexed with a secondary or threedimensional structure of a glycosyltransferase or a binding site as defined in any of the preceding claims, by deleting or adding a chemical group or groups;
 - (b) determining a conformation of the complex with a favourable geometric fit and favourable complementary interactions; and
 - (c) identifying a compound that best fits the binding cavity as a potential modulator of a glycosyltransferase.
- 26. A method for identifying a potential modulator of a glycosyltransferase function comprising the steps:
 - (a) selecting a computer representation of a compound complexed with a secondary or threedimensional structure of a glycosyltransferase or a binding site as defined in any of the preceding claims; and
 - (b) searching for molecules in a data base that are similar to the compound using a searching computer program, or replacing portions of the compound with similar chemical structures from a data base using a compound building computer program.
- 27. A modulator of a glycosyltransferase identified by a method as claimed in any of the preceding claims.
- 28. A method for designing potential inhibitors of a glycosyltransferase comprising the step of using the structural coordinates of a sugar nucleotide donor or acceptor or component thereof, defined in relation to it spatial association with the three dimensional structure of a glycosyltransferase or a binding site as defined in any of the preceding claims, to generate a compound that is capable of associating with the glycosyltransferase or binding cavity thereof.
- 29. A modulator of a glycosyltransferase based on a three-dimensional structure of a sugar nucleotide donor, an acceptor, or a component thereof, defined in relation to the sugar nucleotide donor's or acceptor's spatial association with a secondary or three-dimensional structure of a glycosyltransferase or binding site as defined in the preceding claims.
- 30. A pharmaceutical composition comprising a modulator as claimed in any of the preceding claims either alone or with other active substances.

- 31. A method of treating a disease associated with a glycosyltransferase with inappropriate activity in a cellular organism, comprising:
 - (a) administering a pharmaceutical composition as claimed in claim 30; and
 - (b) activating or inhibiting a glycosyltransferase to treat the disease.
- 32. Use of a modulator identified by the methods of any of the preceding claims in the preparation of a medicament to treat a disease associated with a glycosyltransferase with inappropriate activity in a cellular organism.
- 33. Use of structural coordinates of a glycosyltransferase structure as set out in Table 1, 2, 3, or 4 to manufacture a medicament.
- 34. Machine readable media encoded with data representing the structural coordinates of a secondary or three-dimensional structure of a glycosyltransferase or a binding site as defined in any of the preceding claims.
- 35. A machine readable media as claimed in claim 34 wherein the data also includes structural coordinates for a nucleotide sugar donor, acceptor, metal cofactor, or heavy metal atom.

12243.23USWO

ABSTRACT

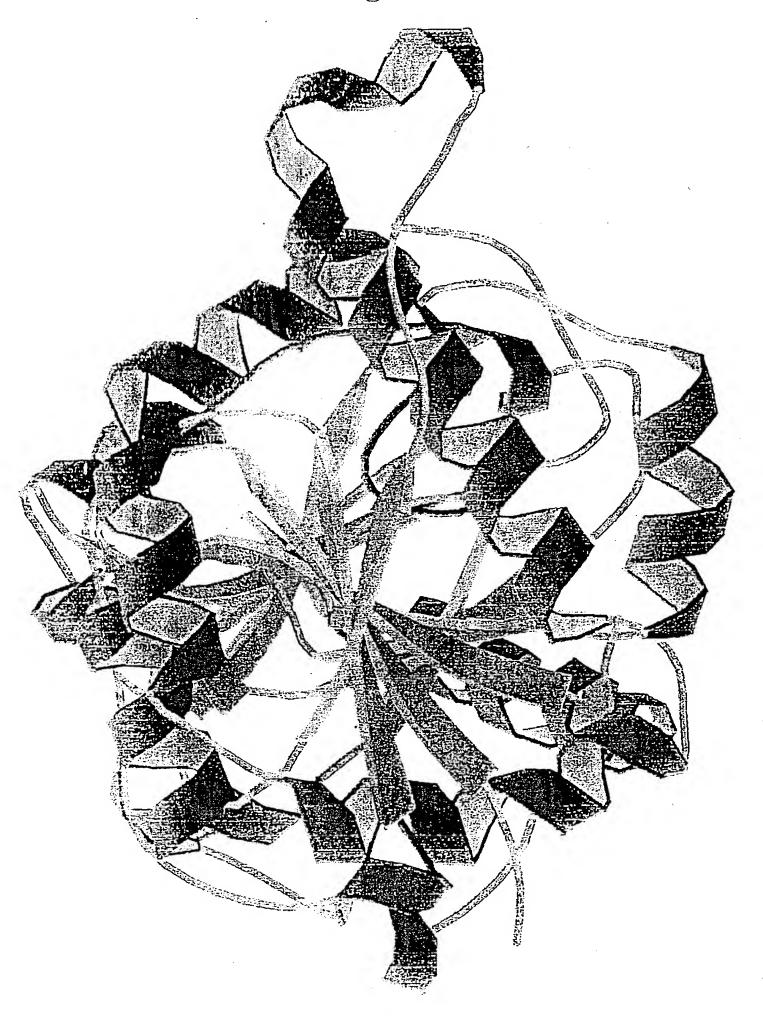

The invention relates to the three dimensional structure of a glycosyltransferase. The atomic coordinates that define the structure and any compounds bound to the structure enable the determination of the three dimensional structures of glycosyltransferases with unknown structure, and the identification of modulators of a glycosyltransferase.

I hereby claim the benefit under Title 35, United States Code § 119(e) of any United States provisional application(s) listed below:

U.S. PROVISIONAL APPLICATION NUMBER	DATE OF FILING (Day, Month, Year)	
60/139,949	18 June 1999	
60/161,809	27 October 1999	
60/178,401	27 January 2000	
60/202,509	5 May 2000	

I acknowledge the duty to disclose information that is material to the patentability of this application in accordance with Title 37, Code of Federal Regulations, § 1.56 (reprinted below):

§ 1.56 Duty to disclose information material to patentability.

or

- (a) A patent by its very nature is affected with a public interest. The public interest is best served, and the most effective patent examination occurs when, at the time an application is being examined, the Office is aware of and evaluates the teachings of all information material to patentability. Each individual associated with the filing and prosecution of a patent application has a duty of candor and good faith in dealing with the Office, which includes a duty to disclose to the Office all information known to that individual to be material to patentability as defined in this section. The duty to disclose information exists with respect to each pending claim until the claim is canceled or withdrawn from consideration, or the application becomes abandoned. Information material to the patentability of a claim that is canceled or withdrawn from consideration need not be submitted if the information is not material to the patentability of any claim remaining under consideration in the application. There is no duty to submit information which is not material to the patentability of any existing claim. The duty to disclose all information known to be material to patentability of any claim issued in a patent was cited by the Office or submitted to the Office in the manner prescribed by §§ 1.97(b)-(d) and 1.98. However, no patent will be granted on an application in connection with which fraud on the Office was practiced or attempted or the duty of disclosure was violated through bad faith or intentional misconduct. The Office encourages applicants to carefully examine:
 - (1) prior art cited in search reports of a foreign patent office in a counterpart application, and
- (2) the closest information over which individuals associated with the filing or prosecution of a patent application believe any pending claim patentably defines, to make sure that any material information contained therein is disclosed to the Office.
- (b) Under this section, information is material to patentability when it is not cumulative to information already of record or being made of record in the application, and
 - (1) It establishes, by itself or in combination with other information, a prima facie case of unpatentability of a claim;
 - (2) It refutes, or is inconsistent with, a position the applicant takes in:
 - (i) Opposing an argument of unpatentability relied on by the Office, or
 - (ii) Asserting an argument of patentability.

A prima facie case of unpatentability is established when the information compels a conclusion that a claim is unpatentable under the preponderance of evidence, burden-of-proof standard, giving each term in the claim its broadest reasonable construction consistent with the specification, and before any consideration is given to evidence which may be submitted in an attempt to establish a contrary conclusion of patentability.

- (c) Individuals associated with the filing or prosecution of a patent application within the meaning of this section are:
 - (1) Each inventor named in the application:
 - (2) Each attorney or agent who prepares or prosecutes the application; and
- (3) Every other person who is substantively involved in the preparation or prosecution of the application and who is associated with the inventor, with the assignee or with anyone to whom there is an obligation to assign the application.
- (d) Individuals other than the attorney, agent or inventor may comply with this section by disclosing information to the attorney, agent, or inventor.
- (e) In any continuation-in-part application, the duty under this section includes the duty to disclose to the Office all information known to the person to be material to patentability, as defined in paragraph (b) of this section, which became available between the filing date of the prior application and the national or PCT international filing date of the continuation-in-part application.

· LIFE TERRETT THE STA

I hereby appoint the following attorney(s) and/or patent agent(s) to prosecute this application and to transact all business in the Patent and Trademark Office connected herewith:
